

# **Scripting Tracker**

Development Tool for SAP GUI Scripting  
Version 6.10

Scripting Tracker is a utility to support the development of SAP GUI Scripting. The UI of the program is designed to offer a better overview by splitting up the work space into tabs. The Analyzer tab shows a well arranged tree with all SAP sessions and their scripting objects. Also it shows for each scripting object, after the selection in the tree with a single mouse click, a lot of technical details like ID, position etc. The Recorder tab shows a basic editor to load, edit and execute SAP GUI scripts. You can select and use the session you want, to run your script with this session.

The Analyzer offers the possibility to identify each scripting object of the SAP GUI with a red frame. There are two ways to achieve this: The first is to select an object from the hierarchy and to press right mouse button. The second is to select an object from the hierarchy and to press the identify button. Next it is necessary to move the mouse pointer to the selected session window. After the identifying of the scripting object it is possible to copy its technical name, called ID, to the clipboard and to use them in another context. This functionality is equal to the SAP GUI Scripting wizard.

With the Recorder the program offers the possibility to record, edit and execute your SAP GUI activities in PowerShell Windows and PowerShell Core, C# (.NET Framework and .NET), VB.NET, Python, JShell for Java, AutoIt, Visual Basic for Applications (VBA), Visual Basic Script (VBS) via Windows Script Host (WSH) and JScript via WSH. Also you can use the code sequences inside RPA platforms.

Scripting Tracker supports the SAP GUI for Windows, with x86 and x64 architecture, and the NetWeaver Business Client (NWBC) for Desktop.

Current Version from 14.08.2024

First Version from 20.10.2012

## **Benefit of Scripting Tracker**

Under normal circumstances you can do with the SAP GUI Scripting recorder the standard to record and replay your manual SAP GUI activities. But sometimes it is not enough. You need an extra editor to customize your scripts. Also, if you record your script, you have no visual contact to the generated code. It is a blind flying to record your activities. Scripting Trackers recorder has the same functionality as SAP GUI Scripting recorder to record and replay SAP GUI Scripts.

Scripting Tracker brings more transparency. With the recorder of Scripting Tracker you have full visual control about the generated scripting code. You see in the integrated basic editor each line which is generated from recorder. And you have the possibility to enrich the code automatically with additional information. Scripting Tracker adds comment lines about the transaction, title, dynpro - program name and screen number - and the session number into your source code.

And Scripting Tracker supports different scripting engines. With Scripting Tracker it is possible to use *PowerShell Windows*, *PowerShell Core*, *C# (.NET Framework and .NET)*, *VB.NET*, *Python*, *Java Shell (JShell)*, *AutoIt*, *Visual Basic for Applications (VBA)*, *VBScript (VBS) of Windows Script Host (WSH)* and *JScript via WSH*. You can record and replay sources of this engines. These different platforms offers now a wide base for total new integration scenarios. With Scripting Tracker it is now easy possible to integrate SAP GUI activities.

Microsoft stops with Windows 7 the delivery of the agents, also known as wizards. But the SAP GUI Scripting tools needs it. Therefore the SAP stops, with the SAP GUI for Windows release 7.20 patch level 9, also the support of the SAP GUI Scripting tools - you can find more information at OSS note 1633639. The Analyzer of Scripting Tracker is an alternative. Scripting Trackers Analyzer has the same functionality as SAP GUI Scripting wizard to identify the scripting objects. It shows all scripting objects in a clearly well arranged tree and, after a selection of one object, a lot of technical details or its position on the GUI with a red frame of the scripting object.

Scripting Tracker supports different SAP UI strategies. Primary it supports SAP GUI Scripting with SAP GUI for Windows, but also with NetWeaver Business Client (NWBC) for Desktop. And it works with Windows 11 and higher. It should also work with Windows 7 and higher, but that is no longer checked.

On the one hand Scripting Tracker optimizes your development process with SAP GUI Scripting. And on the other hand Scripting Tracker offers new horizons of integration between an SAP system and your presentation server. After all, Scripting Tracker brings you a step forward in independence and it increases your efficiency with SAP GUI Scripting.

# Supported Languages of Scripting Tracker

Scripting Tracker supports the languages

- PowerShell Windows
- PowerShell Core
- C# (.NET Framework, .NET 6 and 8)
- VB.NET (.NET Framework)
- Python
- JShell (Java Shell)
- Autolt
- Visual Basic for Applications (VBA) or VBScript (VBS) of the Windows Script Host (WSH)
- JScript of the Windows Script Host (WSH)

To use Scripting Tracker it is necessary to enable and allow the execution of PowerShell on the presentation server, or you can install and use PowerShell Core, Autolt or Python scripting engine as well as JShell. To use C# with .NET 6 or .NET 8 it is necessary to install the appropriate SDK.

**Hint:** PowerShell Windows is in a normal case available on any Windows system, but it is necessary to [set the execution policy](#).

**Hint:** It is not recommended to use VBScript or JScript. These are a deprecated script languages that are no longer being developed. Yes, there are many examples on the internet, especially in VBScript, that can be used, but basically PowerShell should be used for every new development. SAP has described the effects in Note 3484031 - Upcoming deprecation of VBScript by Microsoft - impact on SAP GUI Scripting.

## Enable SAP GUI Scripting

Scripting Tracker uses SAP GUI for Windows with the SAP GUI Scripting API. So it is necessary to enable SAP GUI Scripting on the application and presentation server.

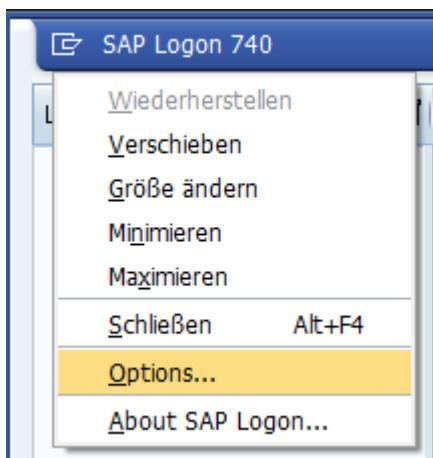

**Hint:** If the SAP GUI Scripting is disable on one application server, you don't see its sessions in the tree.

[On Presentation Server](#)

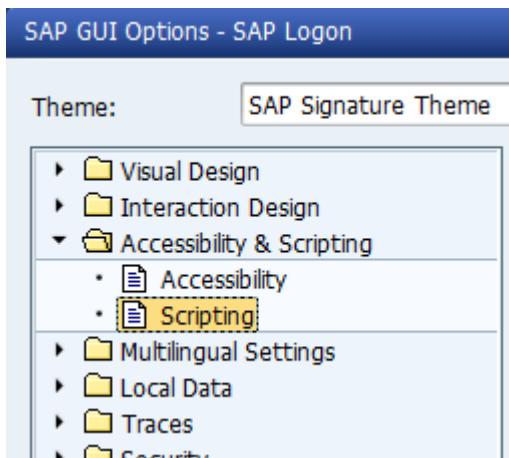

[On Application Server](#)

# Enable SAP GUI Scripting - On Presentation Server

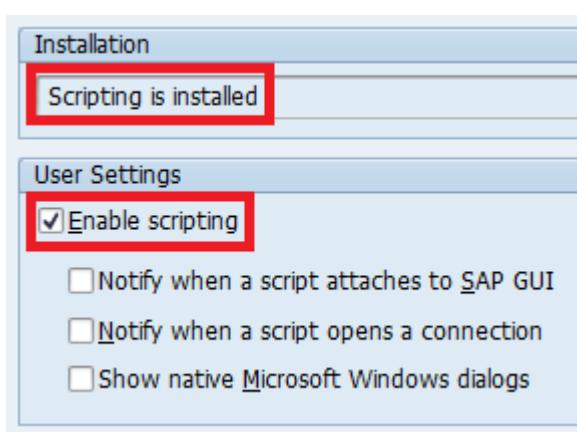

- Choose the menu item Options... from the system menu of the SAP® Logon.

- Choose the node Scripting.

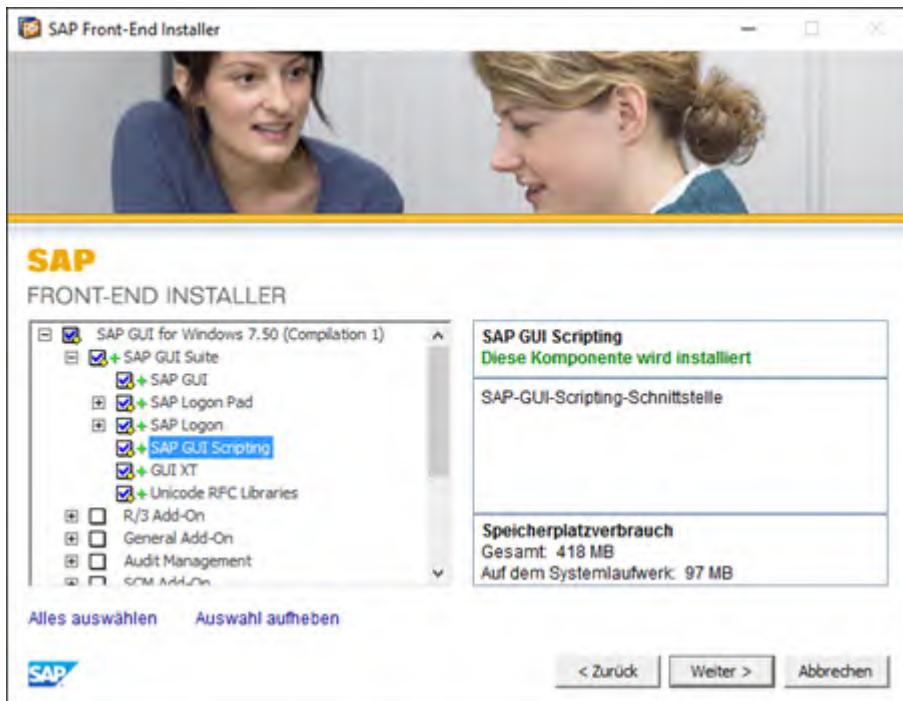

- The Scripting must be installed and activated.

**Hint:** It is necessary to disable the notifications, otherwise you got a requester for each script execution.

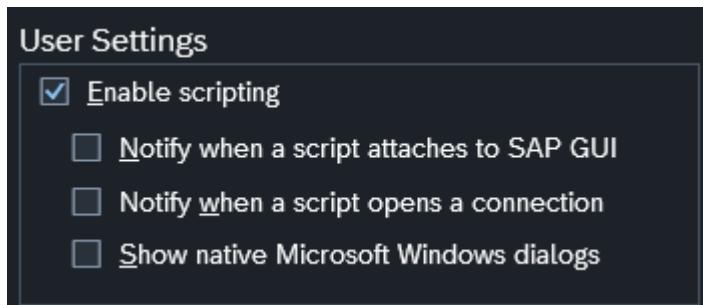

**Hint:** It is necessary to disable the using of native Windows dialogs. On this way the native Windows dialogs, e.g. like Save as or Open, are replaced with a dynpro-based dialog. So you have the possibility to record your activities also with these dialogs.  
An example [how it works in the SAP back-end is here](#) available.

**Hint:** The SAP GUI Scripting is an optional component from the SAP GUI Suite, so it is possible to install the SAP GUI Suite without SAP GUI Scripting and therefore it is necessary to check it.

# Registry Entries of the SAP GUI Scripting on the Presentation Server

You can find [more information about SAP GUI family at the Wiki.](#)

## Enable Scripting

HKEY\_CURRENT\_USER\Software\SAP\SAPGUI Front\SAP Frontend  
Server\Security\UserScripting  
from type REG\_DWORD, Default: 1, 0 = inactive, 1 = active

## Notify when a script attaches to SAP GUI

HKEY\_CURRENT\_USER\Software\SAP\SAPGUI Front\SAP Frontend  
Server\Security\WarnOnAttach  
from type REG\_DWORD, Default: 1, 0 = inactive, 1 = active

## Notify when a script opens a connection

HKEY\_CURRENT\_USER\Software\SAP\SAPGUI Front\SAP Frontend  
Server\Security\WarnOnConnection  
from type REG\_DWORD, Default: 1, 0 = inactive, 1 = active

## Show native MS Windows dialogs

HKEY\_CURRENT\_USER\Software\SAP\SAPGUI Front\SAP Frontend  
Server\Scripting>ShowNativeWinDlgs  
from type REG\_DWORD, Default: 0, 0 = inactive, 1 = active

## Registry Entries - File Save Dialog

In the ABAP code of the method FILE\_SAVE\_DIALOG from the class CL\_GUI\_FRONTEND\_SERVICES is an example available how the registry entry ShowNativeWinDlgs is requested. At first a method is called which detects if scripting is active or not. If it is active it calls the function module GUI\_FILE\_SAVE\_DIALOG, instead of FileSaveDialog of the SAPInfo Control module, which calls the native Windows dialog. This works independently from the SAP GUI for Windows version and from its settings.

```
call method IS_SCRIPTING_ACTIVE receiving result = rt_value EXCEPTIONS others
= 1.

if rt_value = 1.

* check the registry key
call method cl_gui_frontend_services=>registry_get_dword_value
  exporting root = cl_gui_frontend_services=>HKEY_CURRENT_USER
    key = 'Software\SAP\SAPGUI Front\SAP Frontend Server\Scripting'
    value = 'ShowNativeWinDlgs'
  importing reg_value = RCCU
  exceptions
    others = 1.

call method cl_gui_frontend_services=>registry_get_dword_value
  exporting root = cl_gui_frontend_services=>HKEY_LOCAL_MACHINE
    key = 'Software\SAP\SAPGUI Front\SAP Frontend Server\Scripting'
    value = 'ShowNativeWinDlgs'
  importing reg_value = RCLM
  exceptions
    others = 1.

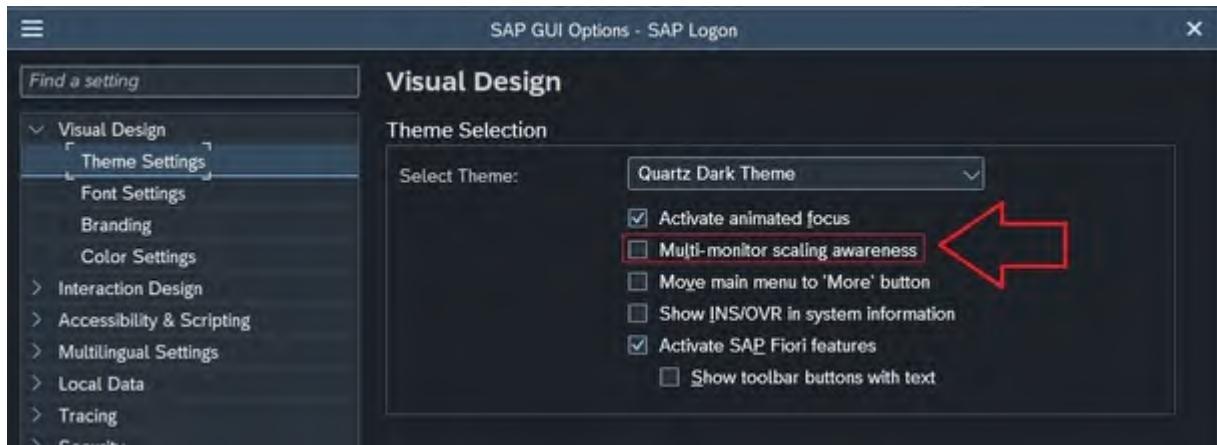

call method cl_gui_cfw=>flush.

if RCCU = 0 or ( RCCU ne 1 and RCLM ne 1 ).
  RT_VALUE = 'X'.
  call FUNCTION 'GUI_FILE_SAVE_DIALOG'
    exporting
      WINDOW_TITLE      = WINDOW_TITLE
      DEFAULT_EXTENSION = DEFAULT_EXTENSION
      DEFAULT_FILE_NAME = DEFAULT_FILE_NAME
      WITH_ENCODING     = WITH_ENCODING
      INITIAL_DIRECTORY = INITIAL_DIRECTORY
      FILE_FILTER       = FILTER
    importing
      FULLPATH         = FULLPATH
      FILE_ENCODING    = FILE_ENCODING
      USER_ACTION      = USER_ACTION.
  endif.

endif.
```

# Multi-monitor Scaling on Presentation Server

The SAP GUI for Windows supports multi-monitor scaling. If scaling is enabled and different monitors are operated with scaling factors other than 100%, it may be that the identifying and the visualization, with the read frame, is out of position. The highlighted fields won't match the cursor's position. That has nothing to do with Scripting Tracker. To prevent this, close all SAP windows, incl. SAP Logon itself, and set the DPI scaling of all monitors to 100% (means, no scaling) in the Windows display setting.

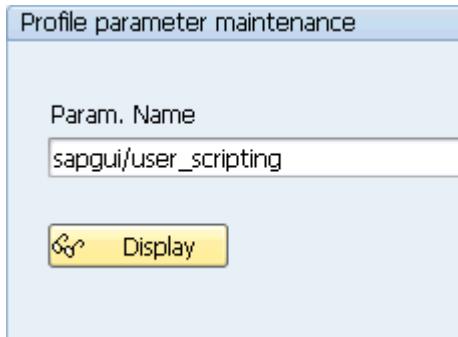

## Enable SAP GUI Scripting - On Application Server

- Use the transaction code RZ11 in the ok field.

- Use the profile parameter sapgui/user\_scripting and press the Display button.

- The current value must be TRUE.

Param. Name	sapgui/user_scripting
Short description(Engl)	Enable or disable user scripting on the frontend.
Appl. area	GUI Frontend
ParameterTyp	Logical value
Changes allowed	Change permitted
Valid for oper. system	All operating systems
DynamicallySwitchable	<input checked="" type="checkbox"/>
Same on all servers	<input type="checkbox"/>
Dflt value	FALSE
ProfileVal	TRUE
Current value	TRUE

The 'Current value' row has a red box around its 'TRUE' entry.

If it is FALSE, press the Change Value button and change it to TRUE on all servers.

**Change Parameter Value**

Parameter values	
Param. Name	sapgui/user_scripting
Dflt value	FALSE
ProfileVal	TRUE
Current value	TRUE
New value	TRUE
<input checked="" type="checkbox"/> Switch on all servers	

Important hint: It is necessary to use only uppercase characters.

- Or to view all profile parameters use the report RSPARAM with transaction code SA38 or SE38.

se38

RSPARAM

Display Profile Parameter					
	Parameter Name	User-Defined Value	System Default Value	System Default Value(Unsubstituted Form)	Comment
	sapgui/user_scripting	TRUE	FALSE	FALSE	Enable or disable user scripting on the frontend.
	sapgui/user_scripting_disable_recording		FALSE	FALSE	Disable the recording capabilities of SAP GUI Scripting
	sapgui/user_scripting_force_notification		FALSE	FALSE	Prevent users from disabling the SAP GUI Scripting notifications.
	sapgui/user_scripting_per_user		FALSE	FALSE	Check user privileges to determine if user scripting should be enabled.
	sapgui/user_scripting_set_READONLY		FALSE	FALSE	Enable or disable a read-only version of SAP GUI Scripting.

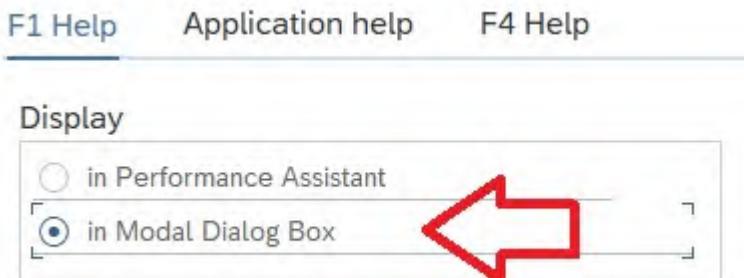

- To set the profile parameter permanent, change to the directory SAP\<SID>\SYS\profile and append to the file <SID>\_<INSTANCE>\_<HOST> e.g. NSP\_DVEBMGS00\_ABAP the line sapgui/user\_scripting = TRUE.
- You can control the SAP GUI Scripting via the following profile parameters:  
 sapgui/user\_scripting = Enable or disable user scripting on the frontend (TRUE)  
 sapgui/user\_scripting\_disable\_recording = Disable the recording capabilities of SAP GUI Scripting (FALSE)  
 sapgui/user\_scripting\_force\_notification = Prevent users from disabling the SAP GUI Scripting notifications (FALSE)  
 sapgui/user\_scripting\_per\_user = Check user privileges to determine if user scripting should be enabled (FALSE)  
 sapgui/user\_scripting\_set\_READONLY = Enable or disable a read-only version of SAP GUI Scripting (FALSE)

# Personal Settings on the Application Server

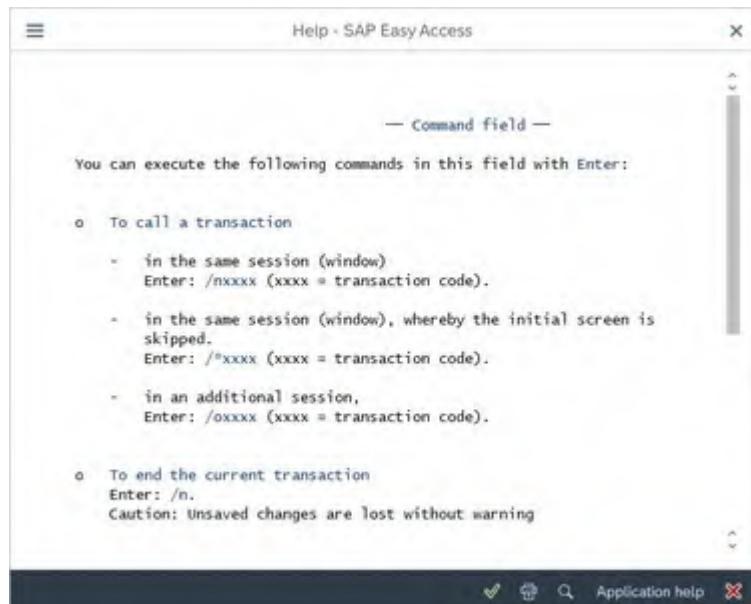

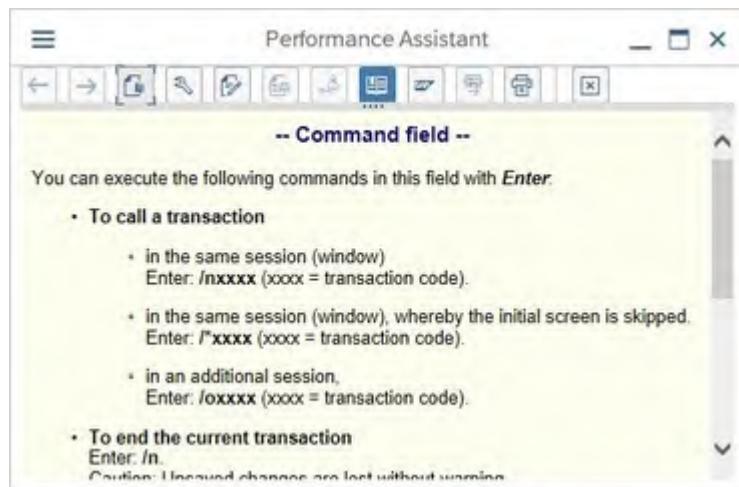

In the menu Help > Settings of the SAP GUI for Windows there is the possibility to customize personal settings. To ensure the automation of the F1 and F4 help, settings must be made at this point.

## F1 Help

If it is necessary to automate the F1 help, switch from the Performance Assistant to the Modal Dialog Box.

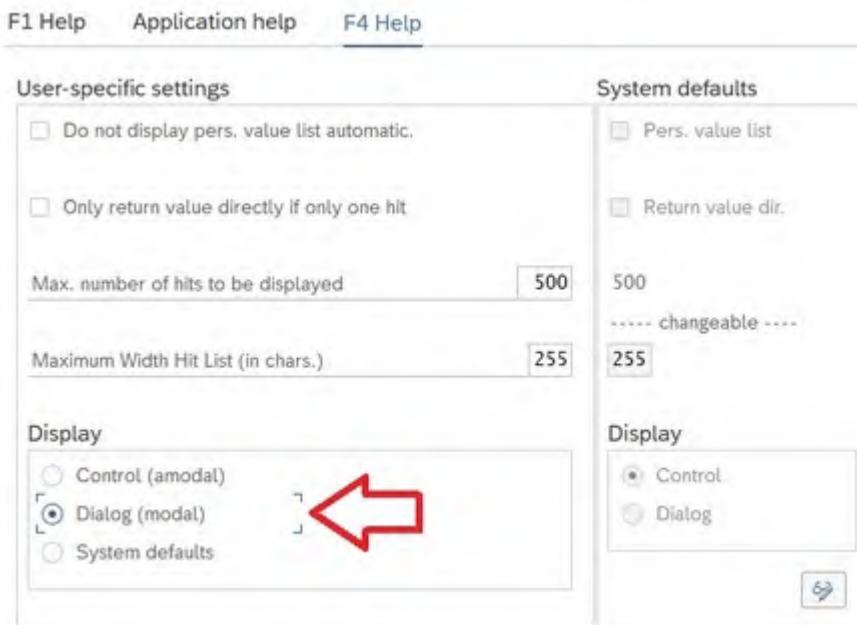

The difference between the Performance Assistant and the Modal Dialog Box is, that the Performance Assistant is an ActiveX control which is not supported by SAP GUI Scripting.

**Hint:** Only in exceptional cases should it be necessary to automate the F1 help.

## F4 Help

To use the F4 help, in the context of an automation, it is necessary to select the Dialog (modal) option in the Display settings.

The difference between the Control (amodal) and the Dialog (modal) is, that the Control (amodal) is an ActiveX control which is not supported by SAP GUI Scripting.

The screenshot compares two selection screens. On the left, under 'Control (amodal)', the interface is a standard SAP list view with a toolbar at the top, a 'Restrictions' section, and a table of airline codes. The table includes columns for ID and Airline, with entries like AA American Airlines, AB Air Berlin, etc. On the right, under 'Dialog (modal)', the interface is a modal dialog box titled 'Airline Code 18 Entries' with a similar structure but without the toolbar. Both screens show 18 entries found at the bottom.

ID	Airline
AA	American Airlines
AB	Air Berlin
AC	Air Canada
AF	Air France
AZ	Alitalia
BA	British Airways
CO	Continental Airlines
DL	Delta Airlines
FJ	Air Pacific
JL	Japan Airlines
LH	Lufthansa
NG	Lauda Air
NW	Northwest Airlines
QF	Qantas Airways
SA	South African Air.
SQ	Singapore Airlines
SR	Swiss
UA	United Airlines

**Hint:** To test the different dialogs use TAC SE38 with the report DEMO\_SELECTION\_SCREEN\_F4.

## Program - Menu

Menu	Description
File Exit	Quits Tracker
Tools Scan	Scans scripting objects of all sessions
Tools Always on top	Tracker window always on top
Tools Running Object Table (ROT)...	Opens a dialog which shows the display names of the running instances which are registered in the running object table (ROT).
Tools Export SAP GUI Scripting API...	Saves the SAP GUI Scripting API as CSV file.
Help Help...	Opens this help file
Help SAP GUI Scripting help...	Optional menu item. If the file SAPGUIScripting.chm is in the same directory as Tracker it will be shown. It opens this SAP® GUI Scripting help file.
Help Autolt help...	Optional menu item. If the keyword AutoltHelp in the ScriptingEngines section of the preference file is set to the Autolt help file in CHM format, this will be open.
Help About...	Shows an additional window with information about Tracker

## Program - Toolbar

Item	Description
 Scan scripting objects of all sessions	Actualize the content of the tree. The progress bar under the toolbar shows the scan activities.
 Tracker window always on top	This is a toggle button. It makes the program window sticky on the desktop.
 About Tracker...	Shows an additional window with information about Tracker.
 Opens help...	Opens this help file.

## Program - Analyzer

Item	Description
 Identify scripting object from SAP® GUI in Tracker hierarchy	This is a toggle button. Put the session to be analysed in foreground, select any object of this session in Tracker hierarchy and switch the button on. Move the mouse pointer to the session and if it is over an scripting object, the object will be marked with a red frame. Also the scripting object and its technical details will be shown in Tracker.
 Find scripting object in Tracker hierarchy	Opens a dialog to input a text to find a scripting object in Tracker hierarchy.
 Find next scripting object in Tracker hierarchy	Continues the search to find a scripting object in Tracker hierarchy.

## Right Mouse Click in the Analyzer Tree

A right mouse click on a session item opens a popup menu.

Menu	Description
Window in foreground	Brings the selected session window in foreground.
Get information	Shows a lot of technical information about the selected session in a message box.
Export IDs to clipboard	Exports all IDs or only the IDs of the user screen of the selected session to the clipboard.
Export IDs to file	Exports all IDs or only the IDs of the user screen of the selected session to a file.

A right mouse click on a scripting object visualize this object with a red frame in the SAP® GUI. This means it shows a red frame around the scripting object in the SAP® GUI of the selected item in Tracker hierarchy tree.

## Program - Recorder

Item	Description
 Clear editor	Clears the editor. If source was changed, the file save dialog will be opened.
 Open file...	Opens a dialog to choose a file to load it in the editor.
 Save file...	Opens a dialog to save the source code as file.
 Save file with standard code...	Opens a dialog to save the source code as file, with additional standard code for SAP GUI Scripting in the head and foot.
 Cut to clipboard	Cuts the selected text from the editor to the clipboard.
 Copy to clipboard	Copies the selected text to the clipboard.
 Paste from clipboard	Pastes text from the clipboard to the actual position of the text cursor.
 Undo	Undo the last activity.
 Redo	Redo the last activity.
 Open source in external editor	Opens the source code with an external editor. If you press the shift button, you add a few lines of code and information. Configure the editors in the section ProgramConfiguration of the Tracker.ini file.
 Reload source from external editor	Reloading the source code from an external editor.
 Code snippet	Inserts a code snippet from Snippets.xml into the editor at the actual cursor position. Look <a href="#">here</a> for further information.
 Playback script	Executes the script from the editor.
 Record SAP® GUI Script	Records SAP® activities to a script in the editor.
 Stop	Stops the executing of the scripting process.

Stop script process	
or Antimalware scan	<p>Scans the script code via Antimalware Scan Interface (AMSI) before it is stored.</p> <p>Configure the risk level in the section ScriptingEngines of the Tracker.ini file. Use the keyword AMSIAcceptedRiskLevel.</p> <p>Green check = AMSI activated Red cross = AMSI deactivated</p> <p><b>Hint:</b> Activate with the Group Policy Editor (gpedit.msc) the setting Computer Configuration &gt; Administrative Templates &gt; Windows Components &gt; Windows PowerShell &gt; PowerShell Script Block Logging.</p>
Use PowerShell® Windows Script	<p>Records and executes the script as PowerShell® Windows script file.</p> <p>Configure the path and file name of the PowerShell® engine in the section ScriptingEngines of the Tracker.ini file. Use the keyword PowerShell.</p>
Use PowerShell® Core Script	<p>Records and executes the script as PowerShell® Core script file.</p> <p>Configure the path and file name of the PowerShell® engine in the section ScriptingEngines of the Tracker.ini file. Use the keyword PowerShellCore.</p>
Use C#	Records the script as C# code for .NET 6.0 or 8.0.
Use C#	Records the script as C# code for the .NET Framework.
Use VB.NET	Records the script as VB.NET code for the .NET Framework.
Use Python	<p>Records and executes the script as Python source.</p> <p>Configure the path and file name of the Python engine in the section ScriptingEngines of the Tracker.ini file. Use the keyword Python.</p>
Use JShell	<p>Records and executes the script as JShell source.</p> <p>Configure the path and file name of the JShell engine in the section ScriptingEngines of the Tracker.ini file. Use the keyword JShell.</p>
Use AutoIt Script	<p>Records and executes the script as AutoIt script file.</p> <p>Configure the path and file name of the AutoIt engine in the section ScriptingEngines of the Tracker.ini file. Use the keyword AutoIt.</p>
Use VBA or VBS via Windows Script Host	Records the script as Visual Basic for Applications (VBA) or records and executes VBScript (VBS) file via Windows Script Host (WSH).

 Use JScript via Windows Script Host	Records and executes the script as JScript file via Windows Script Host (WSH).
 Additional information in source	Enriches the source with information comment lines about the transaction, title, dynpro - program name and screen number - and the session number.
 SAP session	Chooses the SAP session to execute or record the script in it. If a session is selected, the window is set into foreground and some code is added automatically, to identify the connection and session. If no session is chosen the script will be executed as normal script.

## Recorder Editor

- With the key combination Alt + Shift + Arrows it is possible to select a block.

## Right Mouse Click in the Editor

A right mouse click in the editor opens a popup menu.

Item	Description
 Cut to clipboard	Cuts the selected text from the editor to the clipboard.
 Copy to clipboard	Copies the selected text to the clipboard.
 Paste from clipboard	Pastes text from the clipboard to the actual position of the text cursor.
 Undo	Undo the last activity.

 Redo	Redo the last activity.
Add comment	Add a comment sign at the begin of the selected lines.
Remove comment	Remove the comment sign from the begin of the selected lines.
Add two spaces	Add two spaces at the begin of the selected lines.
Add four spaces	Add four spaces at the begin of the selected lines.
 Copy as XML	<p>Copies the selected text to the clipboard and converts it to XML</p> <pre>&amp; to &amp;amp; &lt; to &amp;lt; &gt; to &amp;gt; " to &amp;quot; ' to &amp;apos;</pre>

## Keyboard Shortcuts

Shortcut	Description
Ctrl + G	Inserts Get-Property code for PowerShell.
Ctrl + I	Inserts Invoke-Method code for PowerShell.
Ctrl + S	Inserts Set-Property code for PowerShell.

## Program - Recorder - Console

The Recorder of Scripting Tracker can also be used as independent console application. When the console application is called, the recorded SAP GUI scripting commands are written into the console window.

The recording can be terminated by pressing the Esc key.

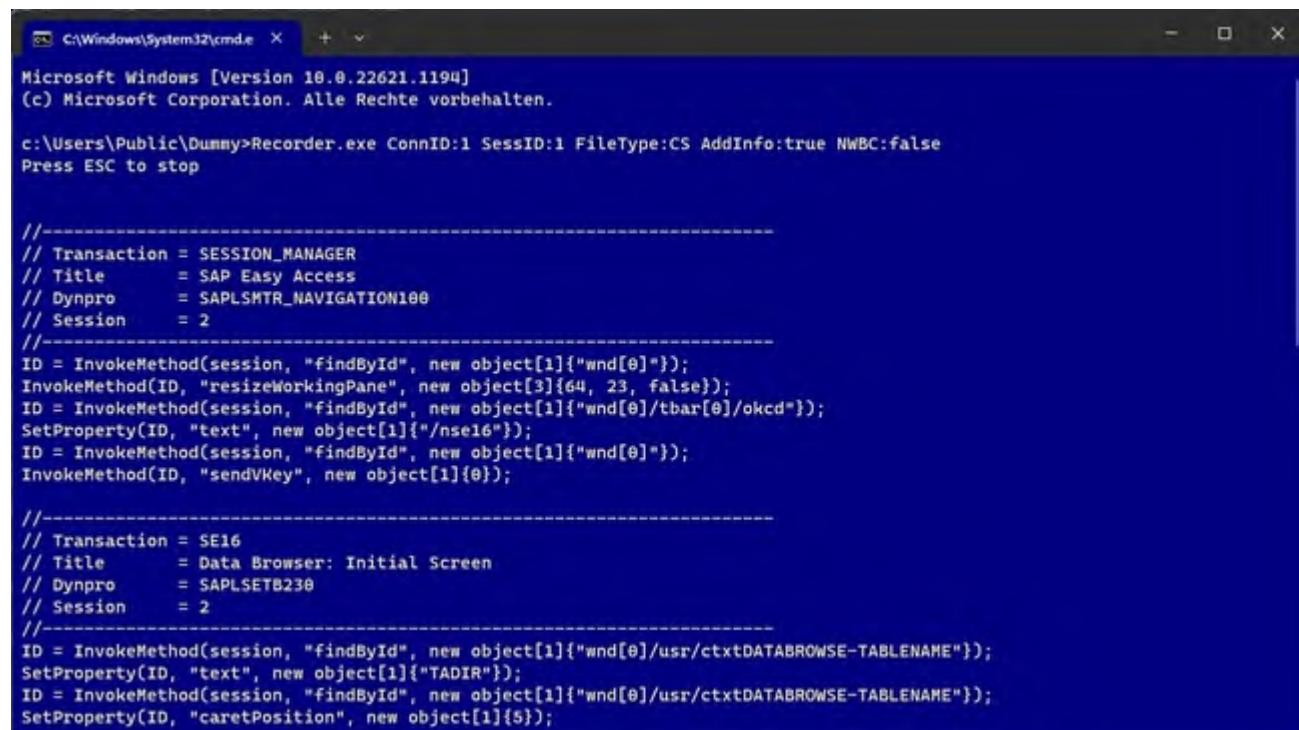

Parameter	Description
ConnID	Connection number as integer, default 0.
SessID	Session number as integer, default 0.
FileType	Type of file as string, default PS1. Permitted values are PS1 for PowerShell, CS for C#, VB for VisualBasic.Net, PY for Python, JAVA for Java, AU3 for AutoIt, VBS for VBScript and JS for JScript.
AddInfo	Flag to add additional information as string, default false or 0. Permitted values are true, 1, false or 0.
NWBC	Flag to automate SAP Business Client as string, default false or 0. Permitted values are true, 1, false or 0.

## Examples

### Windows Console

```
Recorder.exe ConnID:1 SessID:1 FileType:CS AddInfo:true NWBC:false
```

This command executes the Recorder in a console window, to connect to SAP session 1 of connection 1 and records the SAP GUI Scripting commands in C# style with additional information.

```
C:\Windows\System32\cmd.exe + - 

Microsoft Windows [Version 10.0.22621.1194]
(c) Microsoft Corporation. Alle Rechte vorbehalten.

c:\Users\Public\Dummy>Recorder.exe ConnID:1 SessID:1 FileType:CS AddInfo:true NWBC:false
Press ESC to stop

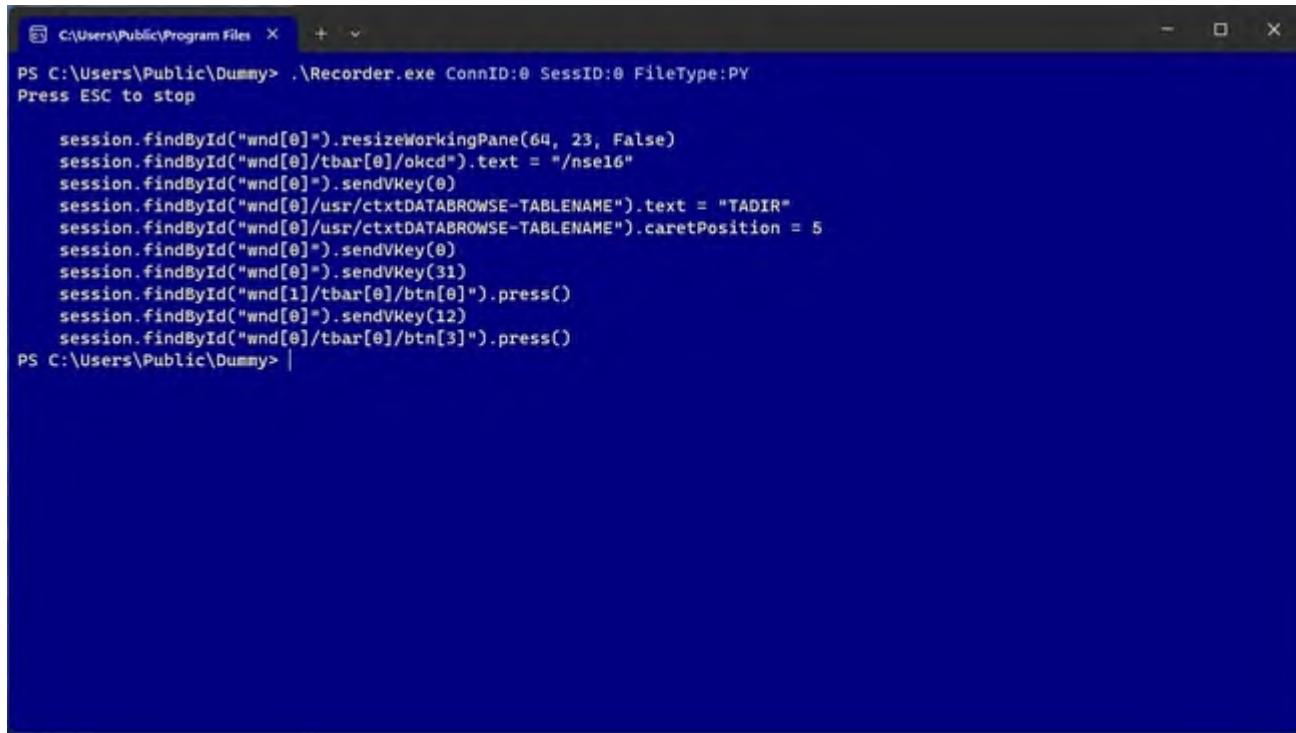

//-
// Transaction = SESSION_MANAGER
// Title      = SAP Easy Access
// Dynpro     = SAPLSMTR_NAVIGATION100
// Session    = 2
//-
ID = InvokeMethod(session, "findById", new object[1]{"wnd[0]"});
InvokeMethod(ID, "resizeWorkingPane", new object[3]{64, 23, false});
ID = InvokeMethod(session, "findById", new object[1]{"wnd[0]/tbar[0]/okcd"});
SetProperty(ID, "text", new object[1]{"/nse16"});
ID = InvokeMethod(session, "findById", new object[1]{"wnd[0]"});
InvokeMethod(ID, "sendVKey", new object[1]{0});

//-
// Transaction = SE16
// Title      = Data Browser: Initial Screen
// Dynpro     = SAPLSETB230
// Session    = 2
//-
ID = InvokeMethod(session, "findById", new object[1]{"wnd[0]/usr/ctxtDATABROWSE-TABLENAME"});
 SetProperty(ID, "text", new object[1]{"TADIR"});
ID = InvokeMethod(session, "findById", new object[1] {"wnd[0]/usr/ctxtDATABROWSE-TABLENAME"});
 SetProperty(ID, "caretPosition", new object[1]{5});
```

## PowerShell

```
.\Recorder.exe ConnID:0 SessID:0 FileType:PY
```

This command executes the Recorder in a PowerShell console window, to connect to SAP session 0 of connection 0 and records the SAP GUI Scripting commands in Python style.

The screenshot shows a Windows PowerShell window titled 'C:\Users\Public\Program Files'. The command entered is '.\Recorder.exe ConnID:0 SessID:0 FileType:PY'. Below the command, a message says 'Press ESC to stop'. The window then displays several lines of SAP GUI scripting code. The code includes commands like 'session.findById("wnd[0]").resizeWorkingPane(64, 23, False)', 'session.findById("wnd[0]/tbar[0]/okcd").text = "/nse16"', and 'session.findById("wnd[0]/usrctxtDATABROWSE-TABLENAME").text = "TADIR"'. The window has a dark blue background and white text.

```
PS C:\Users\Public\Program Files> .\Recorder.exe ConnID:0 SessID:0 FileType:PY
Press ESC to stop

session.findById("wnd[0]").resizeWorkingPane(64, 23, False)
session.findById("wnd[0]/tbar[0]/okcd").text = "/nse16"
session.findById("wnd[0]").sendVKey(0)
session.findById("wnd[0]/usr ctxtDATABROWSE-TABLENAME").text = "TADIR"
session.findById("wnd[0]/usr ctxtDATABROWSE-TABLENAME").caretPosition = 5
session.findById("wnd[0]").sendVKey(0)
session.findById("wnd[0]").sendVKey(31)
session.findById("wnd[1]/tbar[0]/btn[0]").press()
session.findById("wnd[0]").sendVKey(12)
session.findById("wnd[0]/tbar[0]/btn[3]").press()
PS C:\Users\Public\Program Files>
```

```
.\Recorder.exe ConnID:0 SessID:3 FileType:AU3 AddInfo:true >
test.au3
```

This command executes the Recorder in a PowerShell console window, to connect to SAP session 3 of connection 0, records the SAP GUI Scripting commands in Autolt style with additional information and redirects the output to the file test.au3.

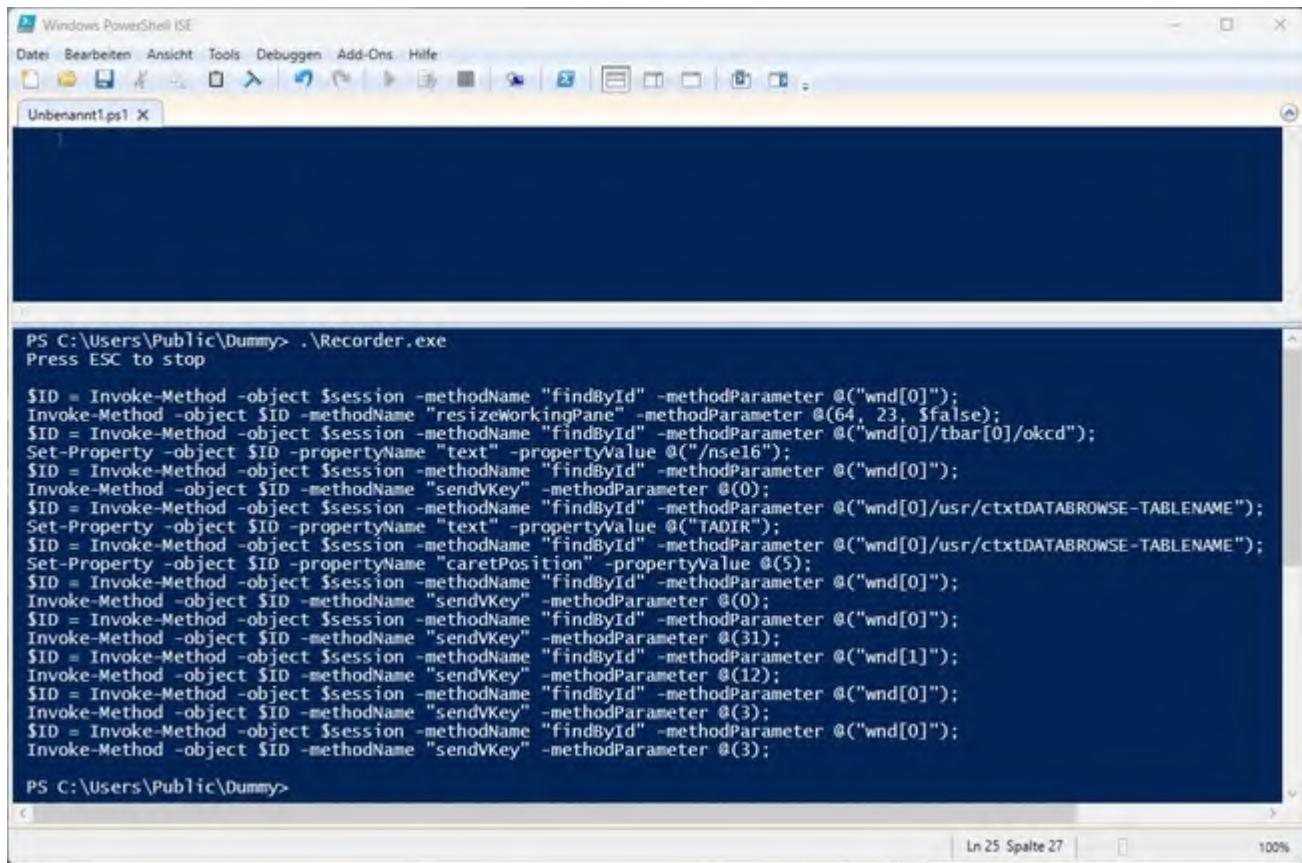

**Hint:** To terminate the recording process activate the PowerShell console window and press the escape key. Do not forget to delete the first line, which contains Press ESC to stop, in the source.

## PowerShell ISE

```
.\Recorder.exe
```

This command executes the Recorder in a PowerShell ISE window, with the default parameter values.

**Hint:** To terminate the recording process activate the PowerShell console window and press the Ctrl and Break key. Do not forget to delete the first line, which contains Press ESC to stop, in the source.

The screenshot shows a Windows PowerShell ISE window titled "Unbenannt1.ps1". The command ".\Recorder.exe" has been run, and the resulting recorded PowerShell script is displayed in the editor pane. The script consists of numerous lines of PowerShell code, primarily using the Invoke-Method cmdlet to interact with UI elements like windows and toolbars. A status bar at the bottom indicates "Ln 25 Spalte 27" and "100%".

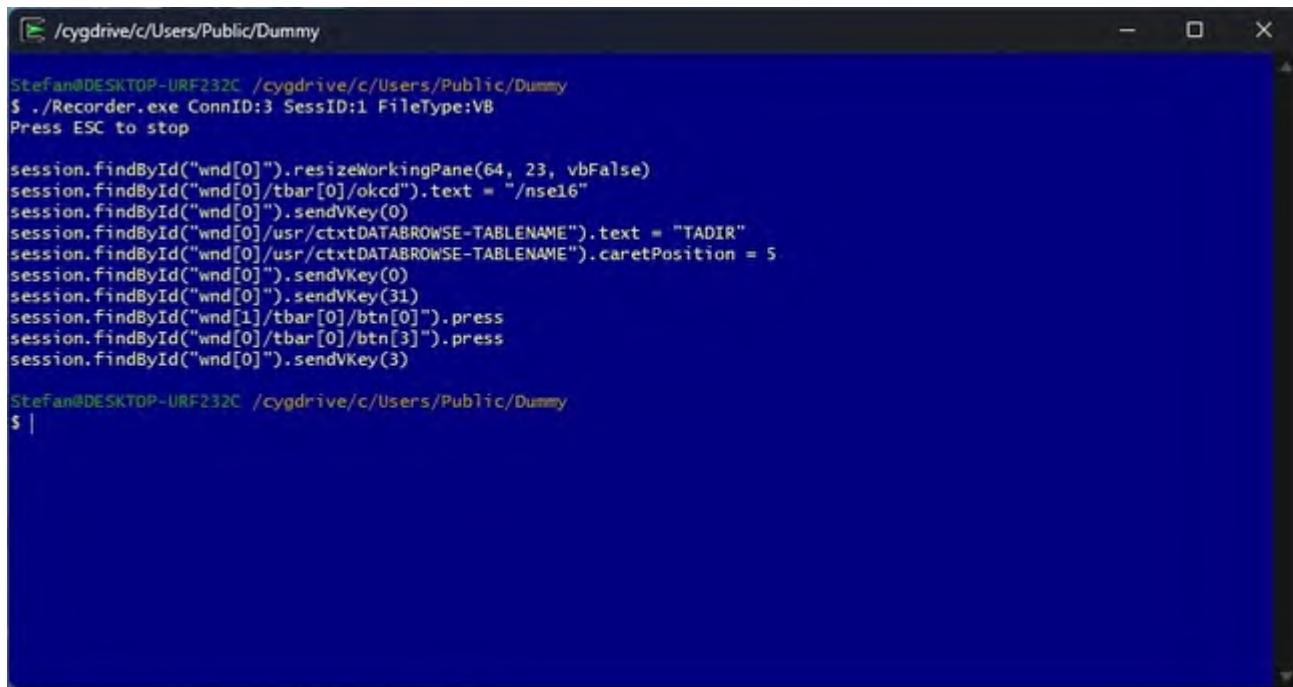

```
PS C:\Users\Public\Dummy> .\Recorder.exe
Press ESC to stop

$ID = Invoke-Method -object $session -methodName "findById" -methodParameter @("wnd[0]");
Invoke-Method -object $ID -methodName "resizeWorkingPane" -methodParameter @((64, 23, $false));
$ID = Invoke-Method -object $session -methodName "findById" -methodParameter @("wnd[0]/tbar[0]/okcd");
Set-Property -object $ID -propertyName "text" -propertyValue @("/nse16");
$ID = Invoke-Method -object $session -methodName "findById" -methodParameter @("wnd[0]");
Invoke-Method -object $ID -methodName "sendVKey" -methodParameter @();
$ID = Invoke-Method -object $session -methodName "findById" -methodParameter @("wnd[0]/usr/cxtxDATAWRITE-TABLENAME");
Set-Property -object $ID -propertyName "text" -propertyValue @("TADIR");
$ID = Invoke-Method -object $session -methodName "findById" -methodParameter @("wnd[0]/usr/cxtxDATAWRITE-TABLENAME");
Set-Property -object $ID -propertyName "caretPosition" -propertyValue @(5);
$ID = Invoke-Method -object $session -methodName "findById" -methodParameter @("wnd[0]");
Invoke-Method -object $ID -methodName "sendVKey" -methodParameter @();
$ID = Invoke-Method -object $session -methodName "findById" -methodParameter @("wnd[0]");
Invoke-Method -object $ID -methodName "sendVKey" -methodParameter @(31);
$ID = Invoke-Method -object $session -methodName "findById" -methodParameter @("wnd[1]");
Invoke-Method -object $ID -methodName "sendVKey" -methodParameter @(12);
$ID = Invoke-Method -object $session -methodName "findById" -methodParameter @("wnd[0]");
Invoke-Method -object $ID -methodName "sendVKey" -methodParameter @(3);
$ID = Invoke-Method -object $session -methodName "findById" -methodParameter @("wnd[0]");
Invoke-Method -object $ID -methodName "sendVKey" -methodParameter @(3);
```

## Bash

```
./Recorder.exe ConnID:3 SessID:1 FileType:VB
```

This command executes the Recorder in a bash console window, to connect SAP session 1 of connection 3 and records the SAP GUI Scripting command in VB.NET style.

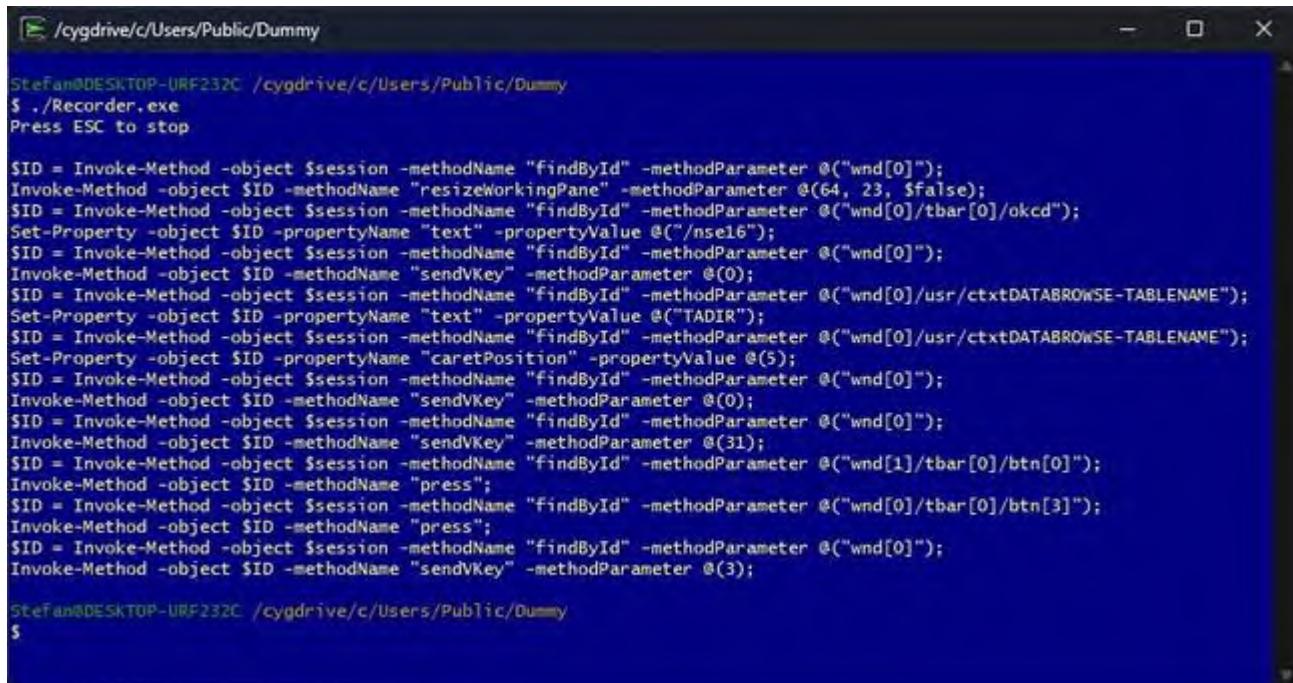

```
Stefan@DESKTOP-URF232C /cygdrive/c/Users/Public/Dummy
$ ./Recorder.exe ConnID:3 SessID:1 FileType:VB
Press ESC to stop

session.findById("wnd[0]").resizeWorkingPane(64, 23, vbFalse)
session.findById("wnd[0]/tbar[0]/okcd").text = "/nse16"
session.findById("wnd[0]").sendVKey(0)
session.findById("wnd[0]/usrctxtDATABROWSE-TABLENAME").text = "TADIR"
session.findById("wnd[0]/usrctxtDATABROWSE-TABLENAME").caretPosition = 5
session.findById("wnd[0]").sendVKey(0)
session.findById("wnd[0]").sendVKey(31)
session.findById("wnd[1]/tbar[0]/btn[0]").press
session.findById("wnd[0]/tbar[0]/btn[3]").press
session.findById("wnd[0]").sendVKey(3)

Stefan@DESKTOP-URF232C /cygdrive/c/Users/Public/Dummy
$ |
```

```
./Recorder.exe
```

This command executes the Recorder in a bash console window, to connect SAP session 0 of connection 0 and records the SAP GUI Scripting commands in PowerShell style. In this example we use the default values ConnID 0, SessID 0, FileType PS1 for PowerShell, AddInfo false and NWBC false.

```
Stefan@DESKTOP-URF232C /cygdrive/c/Users/Public/Dummy
$ ./Recorder.exe
Press ESC to stop

SID = Invoke-Method -object $session -methodName "findById" -methodParameter @("wnd[0]");
Invoke-Method -object $ID -methodName "resizeWorkingPane" -methodParameter @((64, 23, $false));
SID = Invoke-Method -object $session -methodName "findById" -methodParameter @("wnd[0]/tbar[0]/okcd");
Set-Property -object $ID -propertyName "text" -propertyValue @("/nse16");
SID = Invoke-Method -object $session -methodName "findById" -methodParameter @("wnd[0]");
Invoke-Method -object $ID -methodName "sendVKey" -methodParameter @();
SID = Invoke-Method -object $session -methodName "findById" -methodParameter @("wnd[0]/usrctxtDATABROWSE-TABLENAME");
Set-Property -object $ID -propertyName "text" -propertyValue @("TADIR");
SID = Invoke-Method -object $session -methodName "findById" -methodParameter @("wnd[0]/usrctxtDATABROWSE-TABLENAME");
Set-Property -object $ID -propertyName "CaretPosition" -propertyValue @(5);
SID = Invoke-Method -object $session -methodName "findById" -methodParameter @("wnd[0]");
Invoke-Method -object $ID -methodName "sendVKey" -methodParameter @();
SID = Invoke-Method -object $session -methodName "findById" -methodParameter @("wnd[0]");
Invoke-Method -object $ID -methodName "sendVKey" -methodParameter @(31);
SID = Invoke-Method -object $session -methodName "findById" -methodParameter @("wnd[1]/tbar[0]/btn[0]");
Invoke-Method -object $ID -methodName "press";
SID = Invoke-Method -object $session -methodName "findById" -methodParameter @("wnd[0]/tbar[0]/btn[3]");
Invoke-Method -object $ID -methodName "press";
SID = Invoke-Method -object $session -methodName "findById" -methodParameter @("wnd[0]");
Invoke-Method -object $ID -methodName "sendVKey" -methodParameter @(3);

Stefan@DESKTOP-URF232C /cygdrive/c/Users/Public/Dummy
$
```

```
./Recorder.exe FileType:Java > test.java
```

This command executes the Recorder in a bash console window, to connect SAP session 0 of connection 0, records the SAP GUI Scripting commands in Java style and redirects the output to the file test.java.

**Hint:** To terminate the recording process activate the console window and press the escape key. Do not forget to delete the first line, which contains Press ESC to stop, in the source.

## Program - Scripting API

The Scripting API shows in a tree all classes, with its methods and properties, and the enumerations of the SAP GUI Scripting API. Also it shows the arguments and the types of the methods and properties, also the constants of the enumerations. With a double click on a node the text is copied into the clipboard. With a single right click you open the SAP GUI Scripting API help. It is necessary to set the sapfewse variable in the preference file, here it must set the path to sapfewse.ocx file, e.g. like C:\Program Files (x86)\SAP\FrontEnd\SAPgui for the 32-bit version or C:\Program Files\SAP\FrontEnd\SAPgui for the 64-bit version. In the section below you see the Scripting API sorted by methods and properties, to see in which classes are they available. With a double click on one of the classes it will open the class in the tree above.

## Program - Composer

With the composer is it possible to arrange all snippets on an easy way. Choose the type of UI and the programming language. Now you can choose the snippet you like which is inserting at the actual caret position.

Item	Description
 Clear editor	Clears the editor.
 Open file...	Opens a dialog to choose a file to load it in the editor.
 Save file...	Opens a dialog to save the source code as file.
 Cut to clipboard	Cuts the selected text from the editor to the clipboard.
 Copy to clipboard	Copies the selected text to the clipboard.
 Paste from clipboard	Pastes text from the clipboard to the actual position of the text cursor.
 Undo	Undo the last activity.
 Redo	Redo the last activity.
C# to PowerShell	Converts selected C# WebDriver code to PowerShell convention
UTF8 / ASCII	Encoding of the file, default UTF8.

## SAPGUI

A set of snippets to handle SAP® GUI for Windows UI automation via SAP® GUI Scripting API. These are the same snippets as in the recorder.

## Web

A set of snippets to handle web UI automation via Selenium.

- [Selenium](#)
- [Chrome Browser \(Offline Installer\)](#)
- [Chrome WebDriver or from Storage](#)
- [Firefox Browser](#)
- [Mozilla Gecko WebDriver](#)
- [Edge WebDriver](#)
- [Katalon Automation Recorder](#) or from [Chrome Web Store](#)

## Mobile

A set of snippets to handle mobile UI automation for Android devices via Appium.

- [Appium](#)
- [Appium Client Library](#) (Selenium Webdriver extension for Appium)
- [Selenium WebDriver](#) (Supporting browser automation)
- [Selenium WebDriver Support](#) (Supporting Selenium WebDriver)
- [Newtonsoft JSON](#) (JSON framework for .NET)
- [Castle Core](#) (DynamicProxy, Logging Abstractions and DictionaryAdapter)

## Program - Comparator

Item	Description
 Compare screen elements	Compares the selected screens to find different screen elements. This functionality compares the ID, the type and the changeable attribute. If a file is selected, only the IDs are compared.

## Program - DumpState

**Hint:** DumpState ist a method of the GuiVComponent object.

Item	Description
Dump Dumps the state of an object	<p>Delivers a hierarchy of collections with information about the state of an object.</p> <p>The parameter InnerObject may be used to specify for which internal object the data should be dumped. The most complex components supports this parameter. In the most cases it is an empty string.</p> <p>The following OpCode are used:</p> <ul style="list-style-type: none"><li>• GPR = Get Property and Return value</li><li>• MR = Method and Return value</li><li>• GP = Get Property</li><li>• M = Method</li></ul>

### Examples

- Call transaction SESSION\_MANAGER in the SAP GUI for Windows, this is the start screen. Choose in the Analyzer the tree shell and copy the ID in the clipboard. Switch to DumpState, paste the ID and press the Dump button. Now all OpCode are displayed.
- Call transaction SE38 with the report SAP\_PICTURE\_DEMO. Choose in the Analyzer the picture shell and copy the ID in the clipboard. Switch to DumpState, paste the ID and press Dump button. Now all OpCode are displayed.

# Program - Customizing

The button "Edit Preference File" opens the Note tab and the Tracker.ini file.

The button "Edit Snippet File" opens the Note tab and the Snippet.xml file.

## Program

- Path for temporary files  
With the customizing is it possible to change the path of the temporary files on the runtime of Scripting Tacker on restricted areas.
- Delete temporary files
- Execute script without session  
Here you can decide if you want to executes the scripts without a choosen session.
- Add SAP® standard code in source  
If this checkbox is enabled, Tracker enriches the external source file with standard code.

## PowerShell

- Minimized window style for PowerShell session  
Sets the window style of PowerShell to minimized.
- PowerShell session does not exit after running  
Does not close the PowerShell session after executing.

## C#

- Use lambda expressions instead of methods  
To use late binding a set of methods is used, with this option a set of lambda expressions is used instead. The generated source code of the main routine can then be copied directly into the UiPath Invoke Code activity. Uncomment the lines and delete the following line and add a variable from the type Microsoft.VisualBasic.

## Python

- Python session does not exit after running  
Does not close the Python session after executing.

## JShell

- JShell session does not exit after running  
Does not close the JShell session after executing.

## WScript

- Use CScript instead of WScript  
Use console application instead of windows application.
- Shows the registry information about the customizing of enabling Windows Script Host in SysWOW64 node for x86 application, value of Enabled in path SOFTWARE\Microsoft\Windows Script Host\Settings.

## SAP GUI Scripting User Settings

Shows a few registry information about the customization of SAP GUI Scripting in SysWOW64 node for x86 application. You can find more information [here](#).

- Enable Scripting
- Notify when a script attaches to SAP GUI
- Notify when a script opens a connection
- Show native Microsoft Windows dialogs

## Program - Notes

Notes is nothing more than a tiny editor where you can store different text informations.

Item	Description
 Clear notes	Clears the note.
 Open file...	Opens a dialog to choose a file to load it in the note.
 Save file...	Opens a dialog to save the note as file.
 Cut to clipboard	Cuts the selected text from the note to the clipboard.
 Copy to clipboard	Copies the selected text to the clipboard.
 Paste from clipboard	Pastes text from the clipboard to the actual position of the text cursor.
 Undo	Undo the last activity.
 Redo	Redo the last activity.
UTF8 / ASCII	Encoding of the file, default UTF8.

## **Program - Statusbar**

The statusbar on the bottom of the UI is segmented in four areas:

1. Status of the program - Ready or Active.
2. Version of the SAP GUI Scripting.
3. SAPGUI if an instance exists.
4. SAPGUISERVER if one or more instances exists, and in brackets the number of instances.
5. Message from Anti Malware Scan Interface (AMSI)

## Program - Keyboard Shortcuts

Shortcut	Description
Alt + S	Scans the SAP® GUI Scripting objects of all sessions and refresh the content of the tree.
Alt + R	Shrinks the window to the title bar and vis-à-vis.
Alt + Q	Disable the identify scripting object button
Alt + F4	Quits Tracker.
F1	Opens this help file.

## Program - Preference file

It is possible to configure Scripting Tracker via the preference file Tracker.ini. The preference file must be in the same directory as Tracker.exe.

The preference file has two sections. With the first `ProgramConfiguration` it is possible to configure Tracker and with the second `ScriptingEngines` it is possible to set the path to the different scripting engines.

- `ProgramConfiguration`

Keyword	Description
<code>EditorFont</code>	Name of the using font in the editor, default Consolas.
<code>EditorFontSize</code>	Size of the using font in the editor, default 10.
<code>EditorExternalWSH</code>	Path and name of the VisualBasic® editor, default notepad.exe.
<code>EditorExternalAU3</code>	Path and name of the AutoIt editor, default notepad.exe.
<code>EditorExternalPS1</code>	Path and name of the PowerShell® Windows editor, default C:\Windows\System32\WindowsPowerShell\v1.0\powershell_ise.exe.
<code>EditorExternalCorePS1</code>	Path and name of the PowerShell® Core editor, default notepad.exe.
<code>EditorExternalCS</code>	Path and name of the C# editor, default notepad.exe.
<code>EditorExternalVB</code>	Path and name of the VB.NET editor, default notepad.exe.
<code>EditorExternalPY</code>	Path and name of the Python editor, default notepad.exe.
<code>EditorExternalJSH</code>	Path and name of the JShell editor, default notepad.exe
<code>WindowPosSave</code>	0 or 1 to save the window position, default 0
<code>WindowPosX</code>	X position of the window, default 10
<code>WindowPosY</code>	Y position of the window, default 10
<code>WindowPosWidth</code>	Width of the window, default 800
<code>WindowPosHeight</code>	Height of the window, default 800
<code>sapfewse</code>	Path to SAP® frontend Windows® scripting

	engine (sapfewse.ocx)
CodePage	Number of the codepage for the VBS ANSI files, default 1252
NotesFont	Name of the using font in the notes, default Calibri.
NotesFontSize	Size of the using font in the notes, default 12.

- ScriptingEngines

Keyword	Description
Autolt	Path and name of the Autolt engine.
AutoltHelp	Path and name of the Autolt help.
PowerShell	Path and name of the PowerShell® Windows engine.
PowerShellCore	Path and name of the PowerShell® Core engine.
Python	Path and name of the Python engine.
JShell	Path and name of the JShell engine.
AMSIAcceptedRiskLevel	The antimalware provider returns a result between 0 and 32767, inclusive an estimated risk level. With this keyword it is possible to set the sensitivity of the risk level. If the risk level is exceeded, a request dialog appears.

- Tools

In the [Tools] section you have the possibility to implement tools you like in the toolbar of Scripting Tracker. The keyword is shown as tooltip and the value is the program name you want to start.

**Hint:** You can use for the engines, exception PowerShell, and for the external editor paths the %userprofile% environment variable. This contains the profile directory of the user. Typical path is C:\Users\Username.

You can use for JShell path the %java\_home% environment variable.

You can use %programfiles%, %programfiles(x86)% , %windir% and %systemroot% environment variable.

**Example:**

```
[ProgramConfiguration]
EditorFont = Consolas
EditorFontSize = 11
EditorExternalPS1 = %WINDIR%\sysnative\WindowsPowerShell\v1.0\powershell_ise.exe
EditorExternalCorePS1 = %SYSTEMROOT%\SysWOW64\notepad.exe
EditorExternalCS = %SYSTEMROOT%\SysWOW64\notepad.exe
EditorExternalVB = %SYSTEMROOT%\SysWOW64\notepad.exe
EditorExternalWSH = %SYSTEMROOT%\SysWOW64\notepad.exe
EditorExternalAU3 = %SYSTEMROOT%\SysWOW64\notepad.exe
EditorExternalPY = %SYSTEMROOT%\SysWOW64\notepad.exe
EditorExternalJSH = %SYSTEMROOT%\SysWOW64\notepad.exe
WindowPosSave = 0
WindowPosX = 5
WindowPosY = 10
WindowPosWidth = 640
WindowPosHeight = 760
sapfewse = %PROGRAMFILES(X86)%\SAP\FrontEnd\SAPgui
CodePage = 1252
NotesFont = Calibri
NotesFontSize = 12
[ScriptingEngines]
PowerShell = %WINDIR%\sysnative\WindowsPowerShell\v1.0\powershell.exe
PowerShellCore = %USERPROFILE%\PowerShellCore\pwsh.exe
AutoIt = %PROGRAMFILES(X86)%\AutoIt3\AutoIt3.exe
AutoItHelp = %PROGRAMFILES(X86)%\AutoIt3\AutoIt.chm
Python = %USERPROFILE%\Python\python.exe
JShell = %JAVA_HOME%\bin\jshell.exe
[Tools]
AutoItRecorder = C:\Language\AutoIt\Au3Recorder.exe
```

## Program - Snippets file

It is possible to define code snippets via the XML file Snippets.xml. The snippets file must be in the same directory as Tracker.exe.

With the title tag you define the text which is shown in the combobox. With the language tag you define the programming language in whose context the snippet is shown, allowed is here PowerShell, VBNet, CSharp, WScript, AutoIt, Python and Java. In the ui tag you can use any type you like, Scripting Tracker uses SAPGUI, Web and All. With the code tag you define the code which is copied into the editor at the actual cursor position.

```
<?xml version="1.0" encoding="ISO-8859-1"?>

<!DOCTYPE snippets [
<!ELEMENT snippets (snippet)+>
<!ELEMENT snippet (title, language, ui, code)>
<!ELEMENT title (#PCDATA)>
<!ELEMENT language (#PCDATA)>
<!ELEMENT ui (#PCDATA)>
<!ELEMENT code (#PCDATA)>
]>

<snippets>

<snippet>
  <title>Begin</title>
  <language>WScript</language>
  <ui>SAPGUI</ui>
  <code>
'-----Begin-----
</code>
</snippet>

</snippets>
```

**Hint:** Don't use comments in the XML file.

## Program - Unpack Tracker.zip

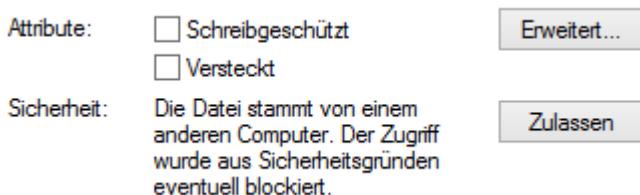

To unpack Tracker.zip use an external unpacker e.g. like 7-Zip. The internal Windows unpacker creates additional files with the extension Zone.Identifier of the unpacked files. These Zone.Identifier files contains information about the source of the file, it is an Alternate Data Stream (ADS). It describes the security zone associated with the file, which may be the Internet (3), local intranet (1), trusted site (2), restricted site (4) or local computer (0). Zone identifier files are generated automatically by Internet Explorer and other programs when files are downloaded to a Windows computer. You can see this files with the command DIR /R. The content looks e.g. like this:

```
[ZoneTransfer]  
ZoneId=3
```

Hint: You can view the file with notepad e.g. like this:

```
notepad Tracker.exe:Zone.Identifier
```

When Tracker.zip is unpacked with an external unpacker, the file properties dialog no longer displays the security notice that the file came from another computer.

## Hints, Tips and Tricks

- If you got an error, it is possible that the line number of the error message is different from the line number in the editor, because Tracker adds a few lines header automatically.

- If you want to compile the C# or VB.NET code, you can use the command lines

vbc.exe [Name of your script file].vb

or

csc.exe /reference:Microsoft.VisualBasic.dll [Name of your script file].cs

For C# it is necessary to add a reference to Microsoft.VisualBasic.dll.

You can download the Roslyn .NET compiler platform from the Nuget Gallery:

<https://www.nuget.org/packages/Microsoft.CodeDom.Providers.DotNetCompilerPlatform>

- Scripting Tracker uses VBScript® only in the context of Windows® Script Host (WSH). If you want to start the SAP® GUI Script via Customize Local Layout > Script Recording and Playback or via drag-and-drop to the session be sure that you don't use any possibilities of the WSH, otherwise you will get an error.
- The WSH offers a lot of additional possibilities, look at the help file, item Windows Script Host Object Model.
- If the program crashes it tries to write a Panic.sav file in the directory of Scripting Tracker.
- If you use another font size in the display setting as 100%, it could be possible that not all field descriptions are fully visible.
- Do not forget to switch the identify button off.
- If you use Scripting Tracker with Windows PowerShell version 2 you must add the following stub in front of your recorded code, because in PowerShell 2 is the variable \$PSScriptRoot not available :

```
If ($PSVersionTable.PSVersion.Major -eq 2) {  
    $PSScriptRoot = Split-Path $($MyInvocation.InvocationName)  
    -Parent  
}
```

- Scripting Tracker offers for transparency different information via OutputDebugString
  - External program calls
  - Details about recordingUse [Sysinternals DebugView](#) to get the information.
- If you use the x86 version of the SAP GUI for Windows, it is recommended to use also the x86 version of Scripting Tracker.  
The x64 version of Scripting Tracker works with the x86 version of SAP GUI for Windows, but in this case the Scripting API cannot be parsed. The result is that the Scripting API tab not being displayed.

```

# SAP GUI Scripting - List of Objects - GuiGridView (ALV)

The ABAP List Viewer (ALV) offers the possibility to view data in a tabular or hierarchical format. The ALV is also known as SAP List Viewer. It offers a friendly interface with a toolbar that allows to adjust the presented layout, to sort or filter data and to export data very easily. SAP offers three different types of the table display.

## ABAP List

This is not an ALV display, this output using the ABAP WRITE command. The difference to the ALV List is the toolbar, e.g. you can not sum, export or filter.

A screenshot of an ABAP List display. The toolbar includes icons for checkmark, dropdown, file, edit, zoom, and a 'Check Table...' button. The table header shows 'Table: SFLIGHT' and 'Displayed Fields: 14 of 14'. A fixed column indicator '4' is shown above the first four columns. The list width is set to 0250. The data consists of 10 rows of flight information:

MANDT	CARRID	CONNID	FLDATE	PRICE	CURRENCY	PLANETYPE	SEATSMAX	SEATSOCC	PAYMENTSUM	SEATSMAX_B	SEATSOCC
001	AA	0017	16.12.2020	422,94	USD	747-400	385	375	193.072,35	31	3

001	AA	0017	30.06.2021	422,94	USD	747-400	385	374	191.828,89	31	2

## ALV List

The ALV List, also known as Classic SAP List Viewer, is very comparable to the ABAP list from the automation perspective, it uses labels too. The data presentation is different and the toolbar offers more features.

A screenshot of an ALV List display. The toolbar includes icons for checkmark, dropdown, file, edit, zoom, and a 'Check Table...' button. The data consists of 10 rows of flight information:

MANDT	CARRID	CONNID	FLDATE	PRICE	CURRENCY	PLANETYPE	SEATSMAX	SEATSOCC	PAYMENTSUM	SEATSMAX_B	SEATSOCC
001	AA	17	16.12.2020	422,94	USD	747-400	385	375	193072,35	31	3
001	AA	17	13.01.2021	422,94	USD	747-400	385	372	192780,52	31	3

001	AA	17	02.06.2021	422,94	USD	747-400	385	372	193973,26	31	3
001	AA	17	30.06.2021	422,94	USD	747-400	385	374	191828,89	31	2

## ALV Grid

The ALV Grid is more like an Microsoft Excel table format

A screenshot of an ALV Grid display. The toolbar includes icons for checkmark, dropdown, file, edit, zoom, and a 'Check Table...' button. The data consists of 10 rows of flight information:

MANDT	CARRID	CONNID	FLDATE	PRICE	CURRENCY	PLANETYPE	SEATSMAX	SEATSOCC	PAYMENTSUM	SEATSMAX_B	SEATSOCC

# SAP GUI Scripting - Object Model

The ID of an UI element represents a object hierarchy for a unique identification.

An example:

/app/con[0]/ses[0]/wnd[0]/usr/cntlIMAGE\_CONTAINER

The ID contains the following elements:

**app** = GuiApplication

Represents the process in which all SAP GUI activities runs, of the SAPlogon process.

**con** = GuiConnection

Represents the connection between SAP GUI and an application server.

**ses** = GuiSession

Represents the context in which a user performs their tasks, e.g. working with a transaction.

**wnd** = GuiMainWindow or GuiModalWindow

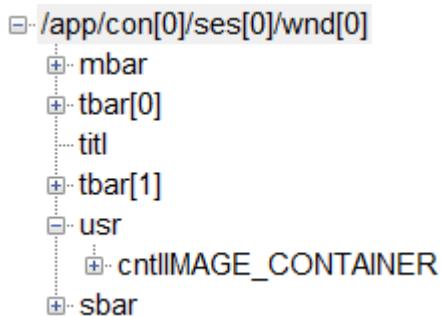

Represents the main window of a SAP GUI session.

After the window follows the [element of the session](#), in this example **usr** for the user screen. But it could also be mbar (menu bar) or tbar (tool bar).

The sum of all these elements are called *parent object ID*.

Now it follows the name of the object, consisting of a [prefix](#), in our case **cntl**, and its technical name, **IMAGE\_CONTAINER**.

If an ID is not unique an one or two dimensional index is added, [0] or [1,2].

# SAP GUI Scripting - Restrictions

This text is an citation from SAP note 587202.

Some technologies are not supported during scripting.

- ***F4 search help control (amodal)***  
The control is not supported in the scripting. Instead, a standard dialog is opened. In some transactions, this dialog does not open and a short dump occurs due to an error in the application. Until a Support Package corrects the application, you can work around this error by using the menu path "Help->Settings->F4" to select the modal dialog manually.
- ***SAPscript***  
The text control of the SAPscript component is not supported. It is replaced by a line editor, as described in SAP Notes 64634 and 100358 (point 10).
- ***Drag and Drop***  
Drag and Drop is not supported in scripting. However, you should have the option of using the function without drag and drop in all applications.
- ***Low-speed connection***  
If the low-speed connection indicator is set for a connection, the system transfers less information to the SAP GUI. As a result, the scripting component is missing the field names that are required for the names and IDs of the objects in the scripting model. Errors then occur (for example, with FindByld).
- ***Missing support in individual transactions***  
Certain transactions use dynamic keywords when communicating with the SAP system; these dynamic keywords change each time the transaction is called. This problem may occur when you select entries from the menu of the toolbar control in particular. If the script that is recorded in this transaction is run again, errors occur due to invalid parameters (for example, in the method SelectMenuItem).
- ***Missing support for certain ActiveX components***  
In order for you to reach an ActiveX control from scripting, scripting support must be made available explicitly. This has already been done for the standard controls. However, some applications contain controls that were developed by customers; no support for scripting exists for them.
- ***No support for Microsoft common dialogs***  
Scripting for common dialogs (such as FileSave, FileOpen) is not supported.
- ***No recording of key combinations or actions that do not change the status of the control***  
The key combinations or other actions that do not cause standard changes of the control - for example, "Copy to Clipboard" (CTRL + C) - are not recorded.
- The "advanced search" in input fields is not supported while scripting is active.

## SAP GUI Scripting - HistoryEnabled

The HistoryEnabled property is set to false, to improve the performance of the SAP GUI.

HistoryEnabled (Read-write)	The local history function can be enabled or disabled using this property. Disabling it will significantly improve the performance of SAP GUI, which may be crucial during load tests, for example.
-----------------------------	---

```
Public Property HistoryEnabled As Byte
```

## SAP GUI Scripting - Backslash in ID

In a few programming languages it is necessary to escape the backslash \ in a string, e.g. in C#, Python or Java. This means it is necessary to add to a single backslash \ character the escape character \\. On this way you double the backslash to \\\. This prevents that the following character is recognized as a function character.

In SAP it is possible that IDs contain a backslash. Therefore it is necessary to add here an escape character.

An example: The following ID ...

```
wnd[0]/usr/tabsTAXI_TABSTRIP_HEAD/tabpT\13/ssubSUBSCREEN_BODY:SAPMV45A:4312/su  
b8309:SAPMV45A:8309/txtVBAK-ZZCON
```

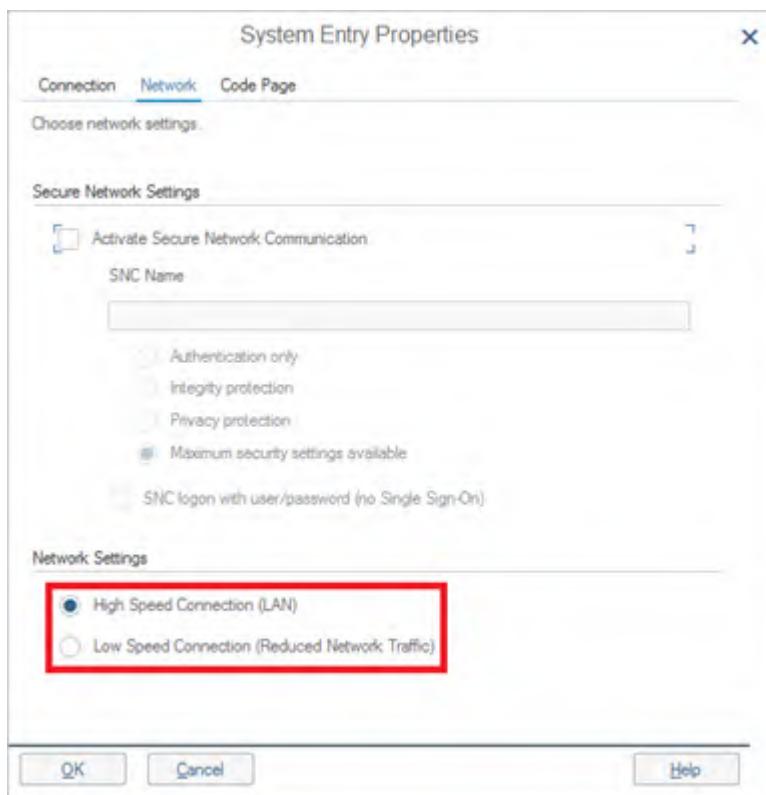

... must be changed.

```
wnd[0]/usr/tabsTAXI_TABSTRIP_HEAD/tabpT\\  
13/ssubSUBSCREEN_BODY:SAPMV45A:4312/sub8309:SAPMV45A:8309/txtVBAK-ZZCON
```

Otherwise the error message "Control ID not found" occurs.

# SAP GUI Scripting - Network Settings

It is necessary to set the network settings of a system entry to high speed connection. If it is set to low speed connection the names of the SAP GUI Scripting objects are not transmitted and therefore IDs don't work.

You can switch between high and low speed of your LAN connection in the properties of each connection in the SAP Logon.

## Network Settings

- High Speed Connection (LAN)
- Low Speed Connection (Reduced Network Traffic)

With low speed connection you loose in some cases information of the ID, here an example. At first recorded code with high speed LAN connection:

```
session.findById("wnd[0]/tbar[0]/okcd").text = "/nSE80"
session.findById("wnd[0]").sendVKey 0
session.findById("wnd[0]/shellcont/shell/shellcont[3]/shell/shellcont[2]/shell").selectNode "1"
session.findById("wnd[0]/shellcont/shell/shellcont[3]/shell/shellcont[2]/shell").nodeContextMenu "1"
session.findById("wnd[0]/shellcont/shell/shellcont[3]/shell/shellcont[2]/shell").selectContextMenuItem "_P__WB_CREATE"
session.findById("wnd[1]/usr/chkRSEUR-WITH_TOP").selected = false
session.findById("wnd[1]/usr/txtRSEUR-TDPROGRAM").text = "Z_TEST"
session.findById("wnd[1]/usr/txtRSEUR-TDPROGRAM").caretPosition = 6
session.findById("wnd[1]/tbar[0]/btn[0]").press
session.findById("wnd[1]/usr/cmbTRDIR-RSTAT").setFocus
session.findById("wnd[1]/usr/cmbTRDIR-RSTAT").key = "T"
session.findById("wnd[1]/tbar[0]/btn[0]").press
```

Here now the same code with low speed LAN connection:

```
session.findById("wnd[0]/tbar[0]/okcd").text = "/nSE80"
session.findById("wnd[0]").sendVKey 0
session.findById("wnd[0]/shellcont/shell/shellcont[3]/shell/shellcont[2]/shell").selectNode "           1"
session.findById("wnd[0]/shellcont/shell/shellcont[3]/shell/shellcont[2]/shell").nodeContextMenu "           1"
session.findById("wnd[0]/shellcont/shell/shellcont[3]/shell/shellcont[2]/shell").selectContextMenuItem "_P_WB_CREATE"
session.findById("wnd[1]/usr/chk").selected = false
session.findById("wnd[1]/usr/txt").text = "Z_TEST"
session.findById("wnd[1]/usr/txt").caretPosition = 6
session.findById("wnd[1]/tbar[0]/btn[0]").press
session.findById("wnd[1]/usr/cmb[1]").setFocus
session.findById("wnd[1]/usr/cmb[1]").key = "T"
session.findById("wnd[1]/tbar[0]/btn[0]").press
```

Here the explanation from SAP note 161053:

When activating the "Low Speed Connection", the dataset sent to the front end is reduced at the expense of the usability. In addition, if you use the "Low Speed Connection" flag, problems can occur in SAP GUI Scripting, since the field names are no longer available in full. Specifically, this results in problems with the use of the command FindById, but also with other commands.

# SAP GUI Scripting - SAPGUI Object

**Hint:** Do not forget to [set the execution policy of PowerShell](#) first.

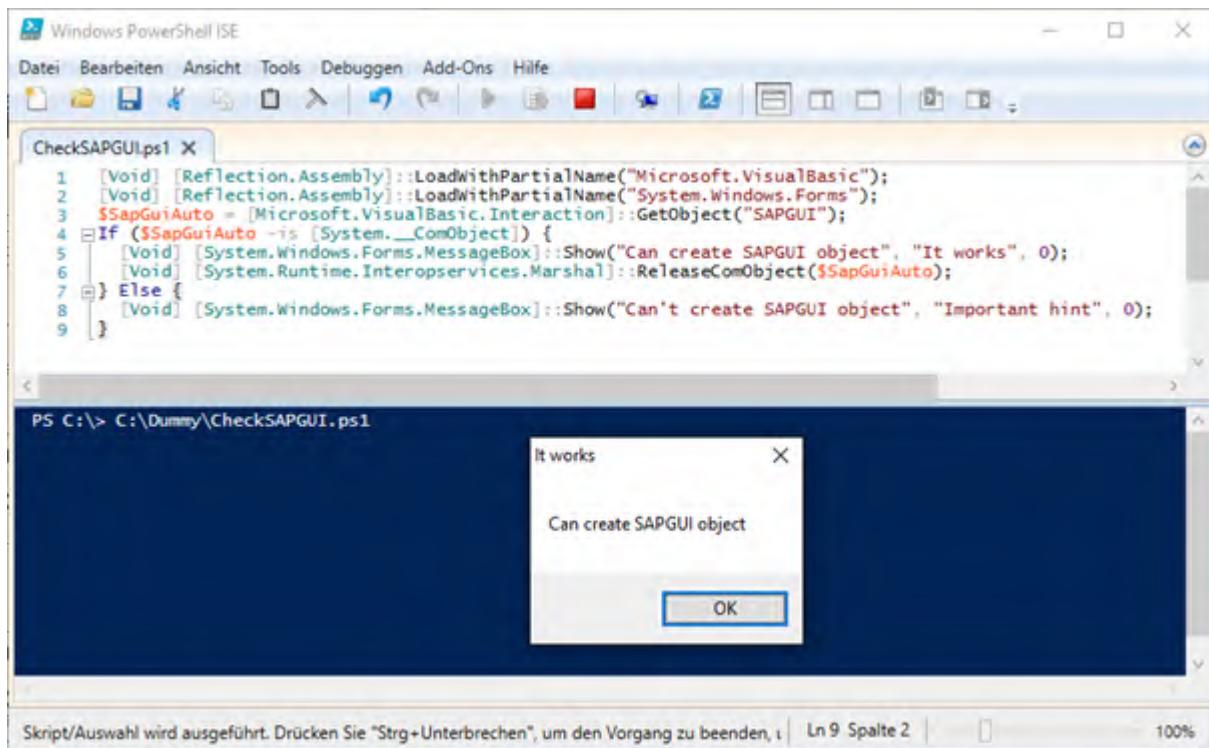

Execute the following code inside your PowerShell ISE to check the SAP GUI class instantiation.

```
Add-Type -AssemblyName "Microsoft.VisualBasic"
Add-Type -AssemblyName "System.Windows.Forms"

$SapGuiAuto = [Microsoft.VisualBasic.Interaction]::GetObject("SAPGUI")

If ($SapGuiAuto -is [System.__ComObject]) {
    [Void] [System.Windows.Forms.MessageBox]::Show("Can create SAPGUI object",
"It works", 0)
    [Void]
[System.Runtime.InteropServices.Marshal]::ReleaseComObject($SapGuiAuto)
} Else {
    [Void] [System.Windows.Forms.MessageBox]::Show("Can't create SAPGUI object",
"Important hint", 0)
}
```

You should see a message box like in the image below.

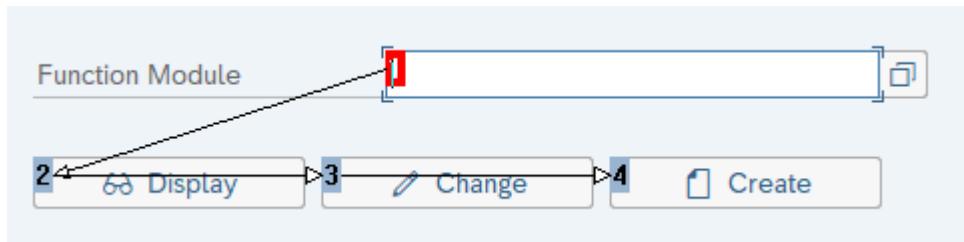

# SAP GUI for Windows - Local Tab Order

The SAP GUI for Windows allows to define for each screen a customizing of the tab order. If you press Ctrl and right mouse button you can find at the end of the context menu these items:

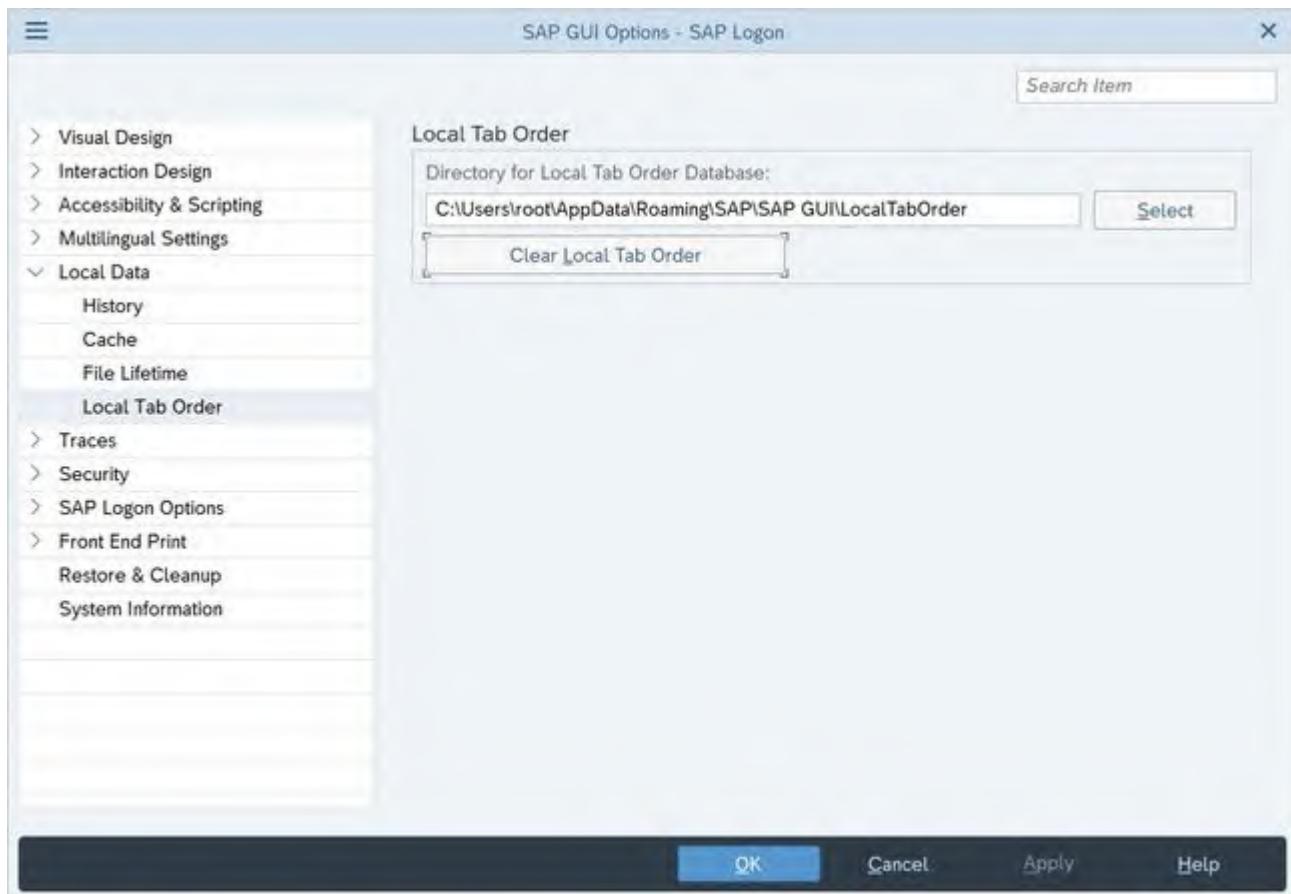

Configure Local Tab Order ( Shift+Ctrl+L)

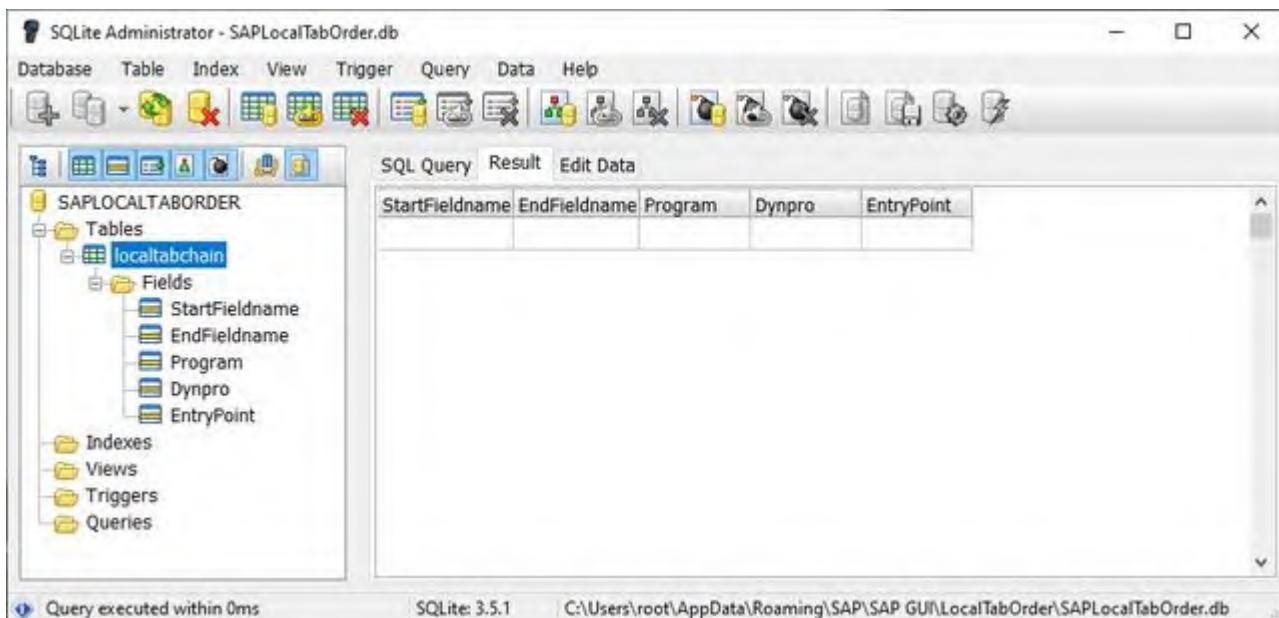

Visualize Local Tab Order ( Shift+Ctrl+A to G)

With Visualize Local Tab Order you can see the sequence of fields if you press the tab key.

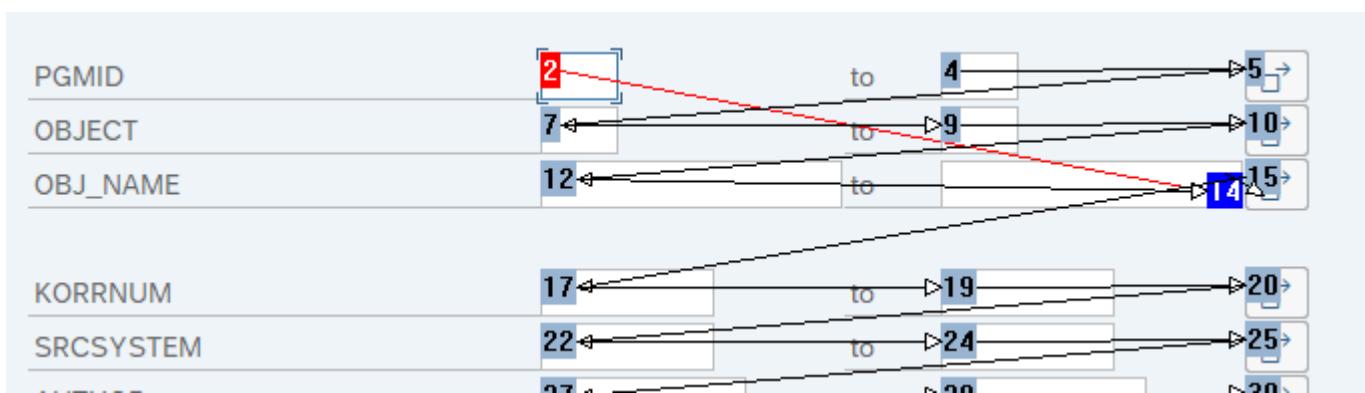

All sequences are stored in a SQLite database, which is defined in the SAP GUI Options:

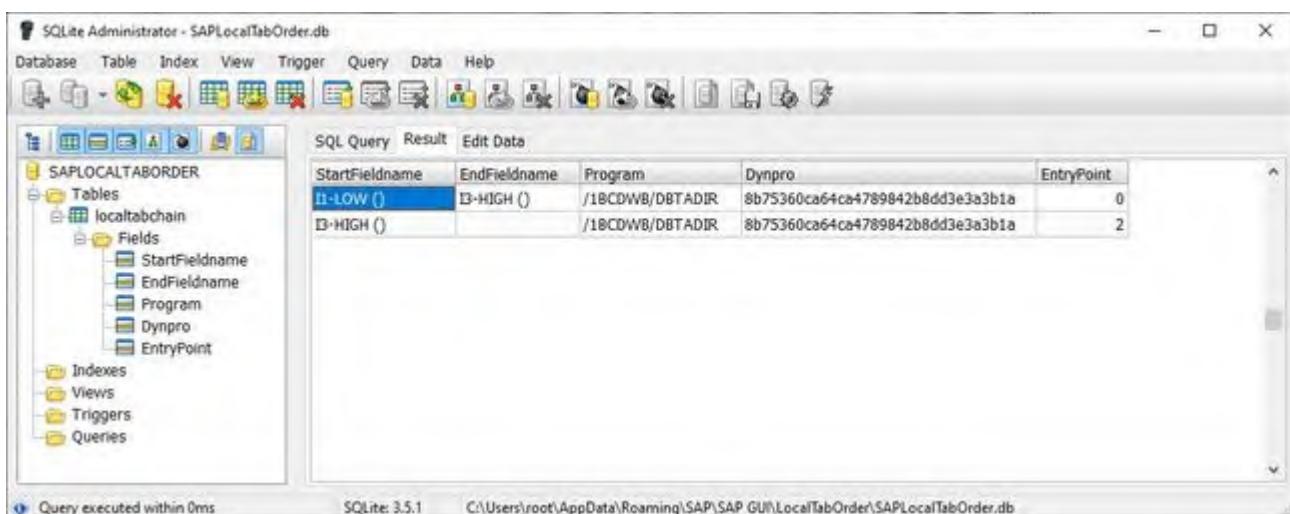

Each user has the possibility to define its own tab order for each screen, with the menu item Configure Local Tab Order. The following example jumps directly from field 2 to 14.

In the SQLite database you can find exact this as Start- and EndFieldname.

Also it is possible to define an exit point at field 14, this means the pressing of the tab key jumps to back button. Here a different perspective via the Configure Local Tab Order dialog.

## Effects on Automation Workflows

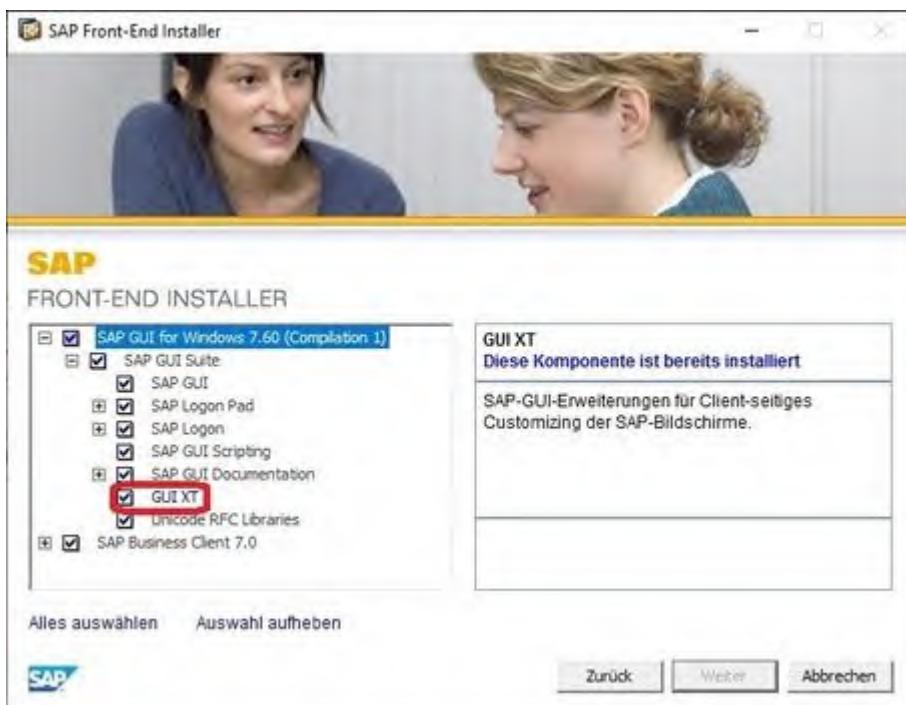

It is possible that your automation doesn't run correctly, when the tab key is used to switch to the fields and the user which executes the workflow has defined a local tab order. There are a lot of conditions. Perhaps there is a small chance that they will occur. But when it does occur, you can spend a lot of time to analyze it to find the reasons of this behavior.

## How can we react to that?

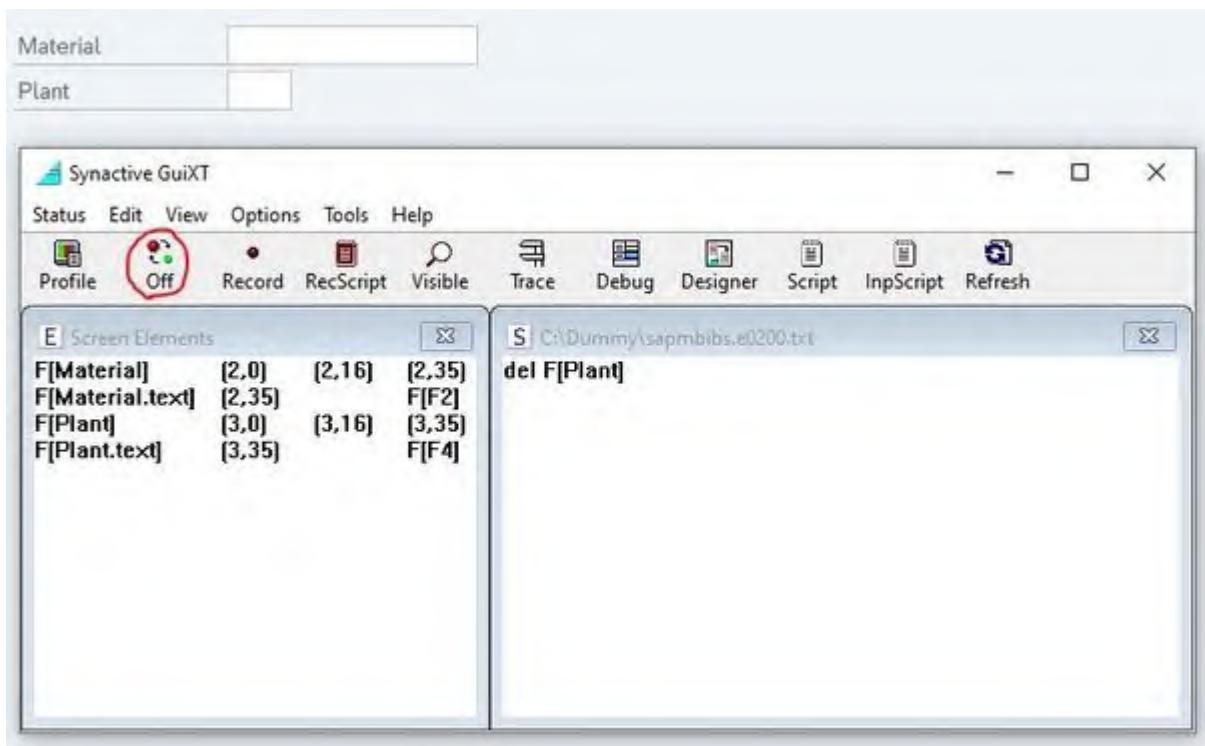

- Don't use the tab key to switch to the fields.
  - Use only the IDs of the fields.
  - It would also be possible to simply clear the database. But here we intervene in the sovereignty of the user settings. In my opinion not a good idea.

# SAP GUI for Windows - GuiXT

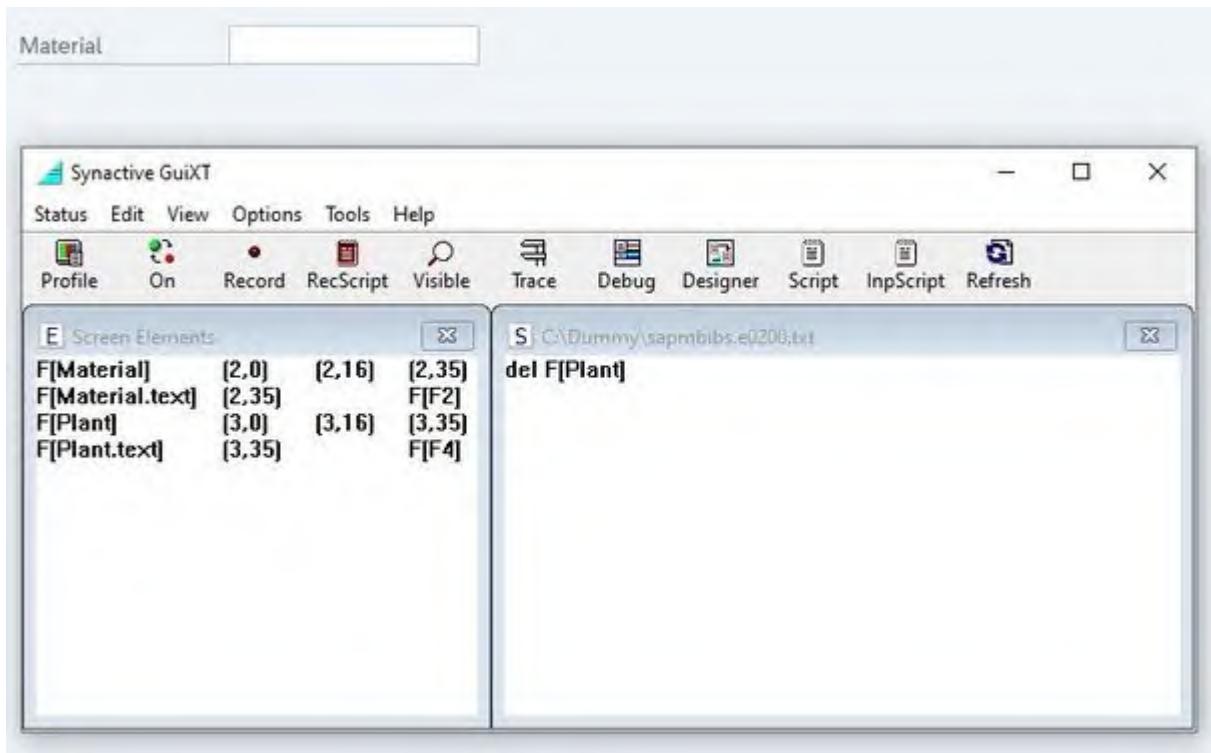

GuiXT is a very impressive SAP GUI for Windows extension. With GuiXT you have the possibility to change existing SAP GUI user screens as you like. A basis functionality is part of the installation of the SAP GUI for Windows.

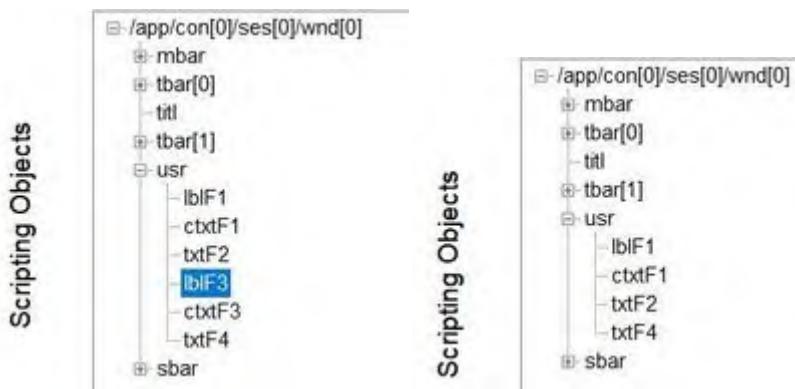

With GuiXT is it possible to change any user screen you like. Here an easy example with labels and fields. In the screen elements you see all UI elements which are available on the user screen. On the right side you see a tiny script, which deletes the Plant label and field, but GuiXT is off.

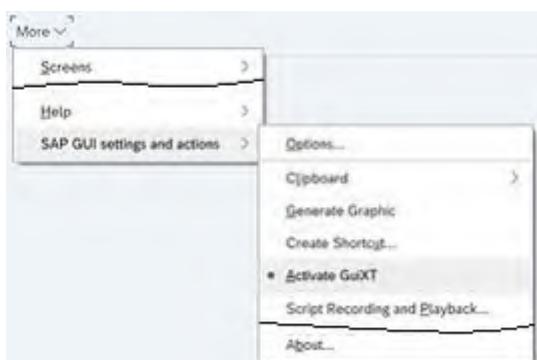

Now GuiXT is on and the screen is refreshed. The label and field Plant are no more longer available.

It is the same in the SAP GUI Scripting object hierarchy. On the left side the label and text F3 are available, but on the right side not, with activated GuiXT.

You can activate GuiXT very easily in the menu.

But what does that possibility mean for SAP automation?

There is a possibility, if you design an automation and the user which runs it uses GuiXT, that it "meets" screens, that it can't process. Fields can't be visible and other fields can exist. GuiXT offers fantastic possibilities here. When analyzing errors, it is always necessary to ask about the use of GuiXT. This can sometimes save you a lot of time and confusion.

**Hint:** GuiXT should always disable in an automation context, because it slows down the UI composition by about 10%. The data stream, via the proprietary Dynamic Information and Action

Gateway (DIAG) protocol, is modified according to the GuiXT scripts. These changes take time and that reduces the performance.

## **PowerShell - Set Execution Policy**

It is necessary to set the execution policy of PowerShell. Open the PowerShell Integrated Scripting Environment (ISE) as administrator and type the following command into the commandline and press return.

```
Set-ExecutionPolicy -ExecutionPolicy RemoteSigned
```

**Hint:** It is necessary to set the execution policy twice, one time for x64 and on time for x86 version. Start one time the ISE from System32 subdirectory and one time from SysWOW64.

## PowerShell - Array of Objects

In a few cases it is possible that PowerShell delivers, instead of one COM object, an array of COM objects. In this case it is not possible to get or set a single property or to call a single method.

The following example, which selects a row in a GuiTableControl and which was recorded, doesn't work:

```
$ID = Invoke-Method -object $ID -methodName "getAbsoluteRow" `  
    -methodParameter @()  
$ID.selected = -1
```

To set the selected property it is necessary to use the following code respectively the code must be adjusted manually:

```
$ID.getAbsoluteRow(14).selected = -1
```

Because getAbsoluteRow delivers in PowerShell a collection of the columns in the row.

## PowerShell - Get Properties of \_\_ComObject

The following code provides information about the characteristics for a GuiShell component with the subtype HTMLViewer, such as its attributes, properties and events.

```
$ID = Invoke-Method -object $session -methodName "findById" ` 
    -methodParameter @("wnd[0]/usr/cntlHTML/shellcont/shell") 

# The Get-Member cmdlet gets the members, properties and methods of objects. 
# But in case of HTMLViewer it delivers only a subset. 
$ID | Get-Member 

# The GetProperties method of the TypeDescriptor class delivers all 
information. 
[System.ComponentModel.TypeDescriptor]::GetProperties($ID)
```

Here an example of a property.

```
Attributes          : {System.ComponentModel.BrowsableAttribute, 
System.Runtime.InteropServices.DispIdAttribute}
CanShow           : True
ComponentType     : System.Windows.Forms.UnsafeNativeMethods+IDispatch
Converter         :
System.Windows.Forms.ComponentModel.Com2Interop.Com2PropertyDescriptor+Com2PropDescMainConverter
ConvertingNativeType : False
DISPID            : 4
DisplayName       : BrowserHandle
IsReadOnly         : True
PropertyType      : System.Windows.Forms.UnsafeNativeMethods+IDispatch
TargetObject      : System.__ComObject
IsLocalizable     : False
SerializationVisibility : Visible
SupportsChangeEvents : False
Category          : Sonstiges
Description        :
IsBrowsable        : False
Name              : BrowserHandle
DesignTimeOnly    : False
```

**Hint:** The property BrowserHandle works only with browser control Internet Explorer in the control settings of the interaction design of the SAP Logon settings.

## Python

- The approach to use SAP GUI Scripting with Python needs PyWin32  
[https://github.com/mhammond/pywin32.](https://github.com/mhammond/pywin32)

## Java™ and JShell

- The approach to use SAP GUI Scripting with Java™ or JShell needs an JDK version 9 or higher.
- Set the JAVA\_HOME environment variable to your JDK directory.
- Add to your path environment variable the bin directory of the JDK directory.
- The approach to use SAP GUI Scripting with Java™ or JShell needs Java COM Bridge (Jacob).  
Jacob is delivered with Scripting Tracker.  
You can find it here: [github.com/freemansoft/jacob-project](https://github.com/freemansoft/jacob-project).
- It is necessary to add the path of the Jacob.jar file to the class path of the Java™ compiler, if you want to compile your code, e.g.  
`javac -CP C:\Dummy\JaCoB SAPGUIScripting.java`
- It is necessary to add the path of the Jacob.jar file to the class path and the path to the native Jacob-DLLs to the java.exe via -Djava.library.path=[Path], if you want to execute your code with Java™ e.g.  
`java -CP .;C:\Dummy\JaCoB -Djava.library.path=C:\Dummy\JaCoB SAPGUIScripting`
- It is necessary to add the path of Jacob.jar file to the class path of JShell, Scripting Tracker does that for you automatically, e.g.  
`/env -class-path C:\Dummy\JaCoB\jacob.jar`
- It is necessary to add the path to the native Jacob-DLLs to the Windows Path environment variable.

# dotNET and VBS - Speed Comparison

## VBScript

```
'-----

# SAP Application Server - SFLIGHT

## Generate Data

It is possible to create or reset the data for the SAP SFLIGHT model via transaction code SE38 and the report SAPBC\_DATA\_GENERATOR. Or you can use the transaction code BC\_DATA\_GEN. The additional SFLIGHT\_DATA\_GEN report fills the database tables STICKET and SNVOICE.

Dataset		Approximate Number of Entries		
		SPFLI	SFLIGHT	SBOOK
Delete Table Entries	<input type="radio"/>	0	0	0
Minimum Data Record	<input type="radio"/>	14	95	28,500
Standard Data Record	<input checked="" type="radio"/>	26	350	100,000
Maximum Data Record	<input type="radio"/>	46	1300	274,000
Monster Data Record	<input type="radio"/>	46	4900	1,300,000
<b>Large data records can only be created in the background.</b>				
<input type="checkbox"/> Canceled Entries in SBOOK				

The following tables will be filled with the report:

Number	Tablename	Description
1	SCARR	Airline
2	SCURX	Currency
3	SCURR	Exchange rates
4	SGEOCITY	Geographical position of a city
5	SAIRPORT	Airports
6	SCITAIRP	City-Airport assignment
7	SAPLANE	Plane
8	SCPLANE	Cargo plane
9	SCUSTOM	Flight customers
10	STRAGELAG	Travel agency
11	SBUSPART	Airline partner
12	SCOUNTER	Sales counter
13	SPFLI	Flight schedule
14	SFLCONNPOS	Stage of a flight connection
15	SFLCONN	Flight connection offered by travel agency

16	SCARPLAN	Plain-airline assignment
17	SMEAL	Inflight meal
18	SMEALT	Inflight meal description
19	SSTARTER	Inflight meal / Appetizer
20	SMACOURSE	Inflight meal / Main course
21	SDESSERT	Inflight meal / Dessert
22	SMENU	Menu
23	SBOOK	Single flight booking
24	SFLIGHT	Flight

## Add Records

With the transaction code BC\_GLOBAL\_SFLGH\_CREA, which calls the report SAPBC\_GLOBAL\_SFLIGHT\_CREATE, it is possible to add additional records to the SFLIGHT table.

1. Select a flight and press Create.

Airline	LH
Connection Number	400
Flight Date	20.04.2020
<b>Create</b>	

2. Add the necessary data and press the save button.

Airline	LH
Connection Number	400
Flight Date	20.04.2020
Airfare	888,00
Airline local currency	EUR
Plane Type	737-800

3. Now you can find the additional record in the table SFLIGHT.

500	LH	0400	28.03.2020	666,00	EUR	A340-600	330	310	258.174,
500	LH	0400	11.04.2020	666,00	EUR	A340-600	330	319	266.200,
500	LH	0400	20.04.2020	888,00	EUR	737-800	140	0	0,
500	LH	0400	28.04.2020	666,00	EUR	A340-600	330	321	270.489,
500	LH	0400	13.05.2020	666,00	EUR	A340-600	330	314	262.910

# VBA - Add Object Library Reference

After opening the Visual Basic for Applications (VBA) IDE choose menu item Tools (Extras) and References... (Verweise...).

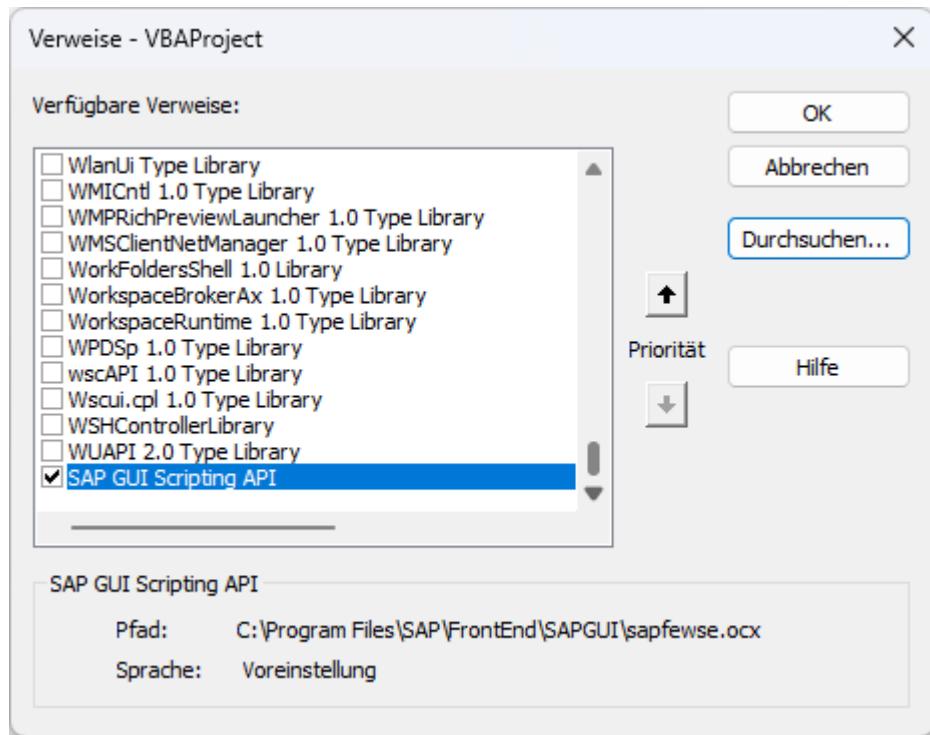

Press Browse... (Durchsuchen...) button.

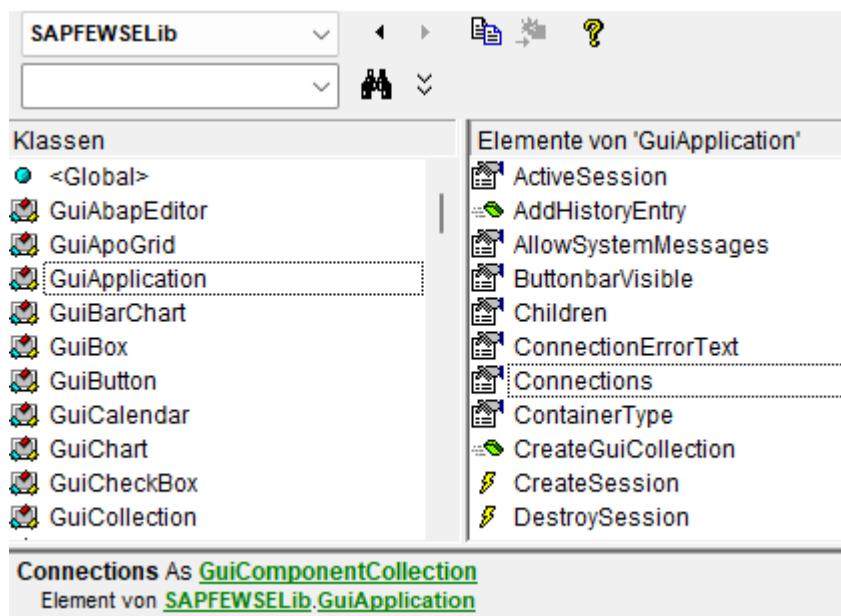

Choose the file `sapfewse.ocx`, from the standard path  
`C:\Program Files\SAP\FrontEnd\SAPGUI`.

Now the SAP GUI Scripting API is directly available in VBA.

Open the Object Browser (Objektkatalog) with F2, to view the object hierarchy with its methods and attributes.

## WSH - Disable

It is possible to disable the Windows Script Host feature on the client.

- Press the **WINDOWS + R** keys, then type **regedit** to open the system registry in edit mode.
- Navigate to  
`HKEY_CURRENT_USER\Software\Microsoft\Windows Script Host\Settings\`
- Create (if it doesn't exist already) a new REG\_DWORD key, call it **Enabled** and assign a value of **0** (zero) to it.
- Navigate to  
`HKEY_LOCAL_MACHINE\Software\Microsoft\Windows Script Host\Settings\`
- Create (if it doesn't exist already) a new REG\_DWORD key, call it **Enabled** and assign a value of **0** (zero) to it.

After that the WSH block should be effective.

To enable the WSH again, set Enabled on the same way to 1 (one).

# Robotic Process Automation

Robotic Process Automation (RPA) platforms, like UiPath or Blue Prism, uses the SAP GUI Scripting API to automate SAP GUI for Windows. The combination of RPA with SAP GUI Scripting offers interesting automation possibilities. The code, generated by Scripting Tracker, can be easily transferred to RPA. This speeds up the development of SAP GUI for Windows code sequences and reduces the possibilities of errors.

Integration scenarios of Scripting Tracker in the development workflow of UiPath on the example of different programming and scripting languages.

[Integration Scenario - UiPath - C#](#)

[Integration Scenario - UiPath - PowerShell Windows](#)

[Integration Scenario - UiPath - AutoIt](#)

[Integration Scenario - UiPath - VBScript](#)

Integration scenarios of Scripting Tracker in the development workflow of Blue Prism with different programming languages.

[Integration Scenario - Blue Prism - C#](#)

[Integration Scenario - Blue Prism - VB.NET](#)

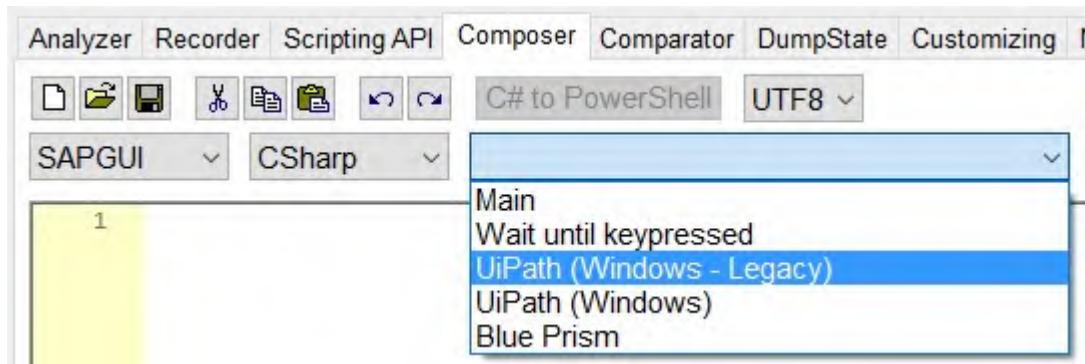

Identifiers play an essential role at automation in the SAP GUI for Windows environment. The highest hierarchical levels are the connection and the session. RPA platforms detects these themselves to ensure high flexibility. Here approaches to use this information in integration scenarios.

[Connection and Session Number - UiPath](#)

[Session ID and Session Number - UiPath](#)

## RPA - Integration Scenario - UiPath - C#

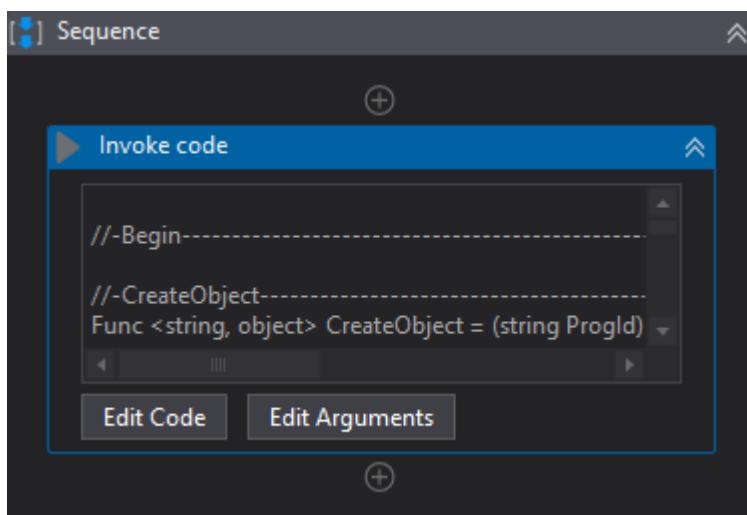

To use C# code with the UiPath Invoke Code activity is very easy. At first you must record your SAP activities with C#. Switch to the Composer tab and insert the SAPGUI > CSharp > UiPath (Windows - Legacy) or UiPath (Windows) code sequence.

Move your recorded SAP activities into the code sequence and replace with it the line  
//>Insert your SAP GUI Scripting code here<

```
56     dynamic ID = null;
57
58 //>Insert your SAP GUI Scripting code here<
59
60     FreeObject(session);
```

Copy now this whole code from the Composer into your UiPath Invoke Code activity.

**Hint:** If your UiPath project is Windows - Legacy it is necessary to add a dummy variable from type Microsoft.VisualBasic.\* to your workflow sequence.

Name	Variable type	Scope	Default
Dummy1	Microsoft.VisualBasic.AppWinStyle	Sequence	Enter a VB expression
<i>Create Variable</i>			

## **Testing**

This approach was successfully tested with UiPath 22.7.0 and SAP GUI for Windows 7.70 PL 7 on Windows 11 in the compatibility modes Windows - Legacy and Windows.

# RPA - Integration Scenario - UiPath - PowerShell Windows

Hint: Don't forget to [set the execution policy](#) first.

## PowerShellScript

```
# Begin-----

# Parameters
Param(
    [String]$ConnectionNumber = "0",
    [String]$SessionNumber = "0"
)

# Includes
."$PSScriptRoot\COM.ps1"

# Main
$SapGuiAuto = Get-Object( , "SAPGUI")
If ($SapGuiAuto -isnot [__ComObject]) {
    Exit
}

$application = Invoke-Method $SapGuiAuto "GetScriptingEngine"
If ($application -isnot [__ComObject]) {
    Free-Object $SapGuiAuto
    Exit
}

$connection = Get-Property $application "Children"
@([convert]::ToInt32($ConnectionNumber, 10))
If ($Null -eq $connection) {
    Free-Object $SapGuiAuto
    Exit
}

$session = Get-Property $connection "Children"
@([convert]::ToInt32($SessionNumber, 10))
If ($Null -eq $session) {
    Free-Object $SapGuiAuto
    Exit
}

$ID = Invoke-Method $session "findById" @("wnd[0]/tbar[0]/okcd")
Set-Property $ID "text" @("/nSE16")
$ID = Invoke-Method $session "findById" @("wnd[0]")
Invoke-Method $ID "sendVKey" @(0)
$ID = Invoke-Method $session "findById"
@("wnd[0]/usr ctxtDATA BROWSE-TABLENAME")
Set-Property $ID "text" @("TADIR")
$ID = Invoke-Method $session "findById"
@("wnd[0]/usr ctxtDATA BROWSE-TABLENAME")
Set-Property $ID "caretPosition" @(5)
$ID = Invoke-Method $session "findById" @("wnd[0]")
Invoke-Method $ID "sendVKey" @(0)
$ID = Invoke-Method $session "findById" @("wnd[0]")
Invoke-Method $ID "sendVKey" @(31)

$ID = Invoke-Method $session "findById" @("wnd[1]/usr/txtG_DBCOUNT")
$dbCount = Get-Property $ID "text"
```

```

$ID = Invoke-Method $session "findById" @("wnd[1]/tbar[0]/btn[0]")
Invoke-Method $ID "press"
$ID = Invoke-Method $session "findById" @("wnd[0]")
Invoke-Method $ID "sendVKey" @(3)
$ID = Invoke-Method $session "findById" @("wnd[0]")
Invoke-Method $ID "sendVKey" @(3)

Free-Object $SapGuiAuto

Set-Content dbCount.txt $dbCount

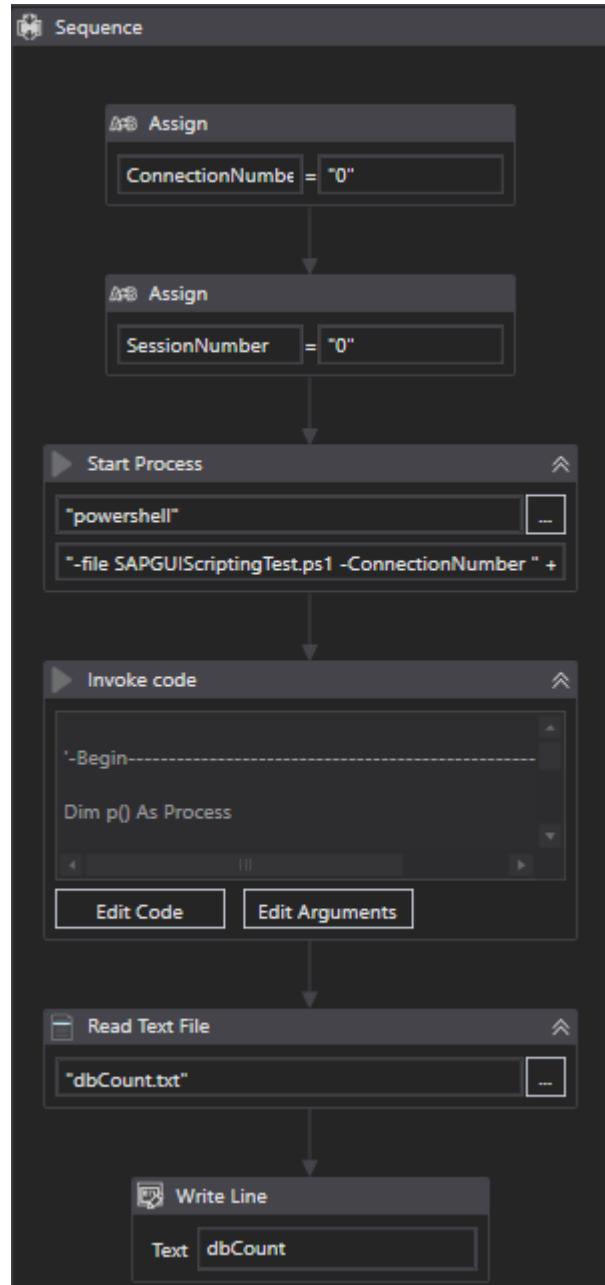

# End-----

```

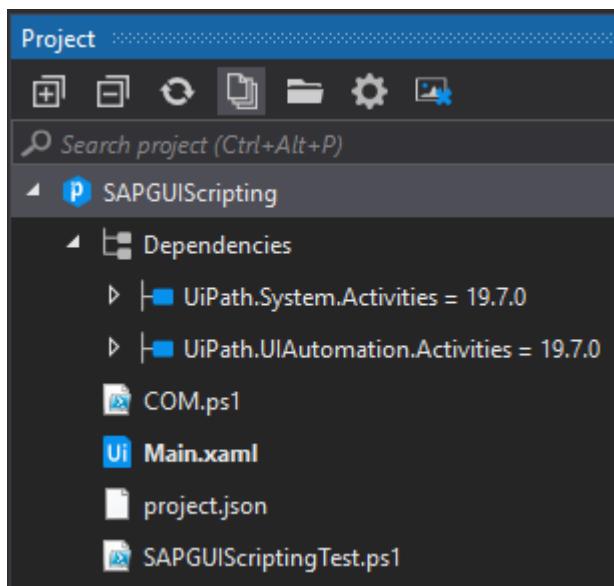

## Variables in UiPath

Name	Variable type	Scope	Default
dbCount	String	Sequence	<i>Enter a VB expression</i>
ConnectionNumber	String	Sequence	<i>Enter a VB expression</i>
SessionNumber	String	Sequence	<i>Enter a VB expression</i>
<i>Create Variable</i>			

## Sequence in UiPath

**Hint:** Store the PowerShell script file and the include into your project folder.

## Properties of Start-Process activity

A screenshot of the UiPath Studio Properties panel for a "Start Process" activity. The activity is of type "UiPath.Core.Activities.StartProcess". The properties shown are:

- Common**:
  - ContinueOnError: "Specifies to continue executing the remaining activities even if the current activity failed. Only boolean values (True, False) are accepted."
  - Display Name: "Start Process"
- Input**:
  - Arguments: "-file SAPGUIScriptingTest.ps1 -ConnectionNumber " + ConnectionNumber + " -SessionNumber " + SessionNumber
  - FileName: "powershell"
  - WorkingDirectory: "Path of the current working directory. This field accepts only string variables. Note: All string variables must be placed between double quotes."
- Misc**:
  - Private

## Code for Invoke Code activity

```
' Begin-----  
  
Dim p() As Process  
  
Do  
    p = System.Diagnostics.Process.GetProcessesByName("powershell")  
    System.Threading.Thread.Sleep(500)  
Loop Until p.Length = 0  
  
' End-----
```

**Hint:** To get the result from the PowerShell script the content of the file dbCount.txt is read.

# RPA - Integration Scenario - UiPath - AutoIt

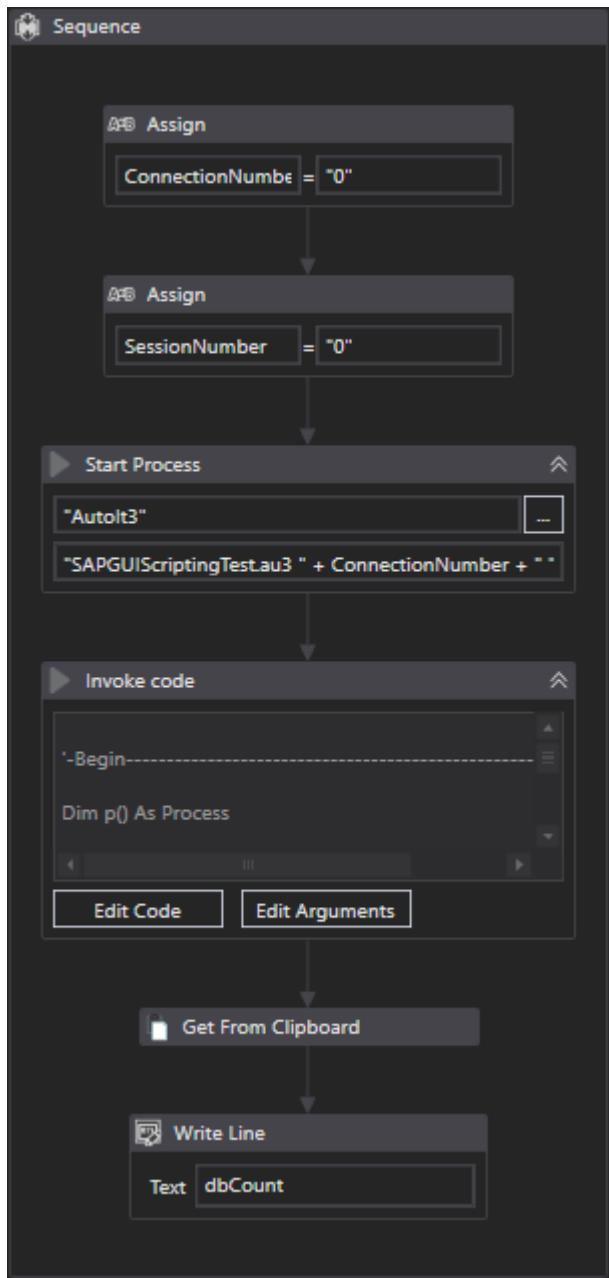

## AutoItScript

```
; Begin-----  
  
AutoItSetOption("MustDeclareVars", 1)  
  
Dim $ConnectionNumber, $SessionNumber  
Dim $SapGuiAuto, $application, $connection, $session, $dbCount  
  
$ConnectionNumber = Number($CmdLine[1])  
$SessionNumber = Number($CmdLine[2])  
  
$SapGuiAuto = ObjGet("SAPGUI")  
If Not IsObj($SapGuiAuto) Or @Error Then  
    Exit  
EndIf  
  
$application = $SapGuiAuto.GetScriptingEngine()  
If Not IsObj($application) Then  
    Exit  
EndIf  
  
$connection = $application.Children($ConnectionNumber)  
If Not IsObj($connection) Then  
    Exit  
EndIf  
  
$session = $connection.Children($SessionNumber)  
If Not IsObj($session) Then  
    Exit  
EndIf  
  
$session.findById("wnd[0]/tbar[0]/okcd").text = "/nSE16"  
$session.findById("wnd[0]").sendVKey(0)  
$session.findById("wnd[0]/usr/ctxtDATABROWSE-TABLENAME").text = "TADIR"  
$session.findById("wnd[0]/usr/ctxtDATABROWSE-TABLENAME").caretPosition = 5  
$session.findById("wnd[0]").sendVKey(0)  
$session.findById("wnd[0]").sendVKey(31)  
  
$dbCount = $session.findById("wnd[1]/usr/txtG_DBCOUNT").text  
  
$session.findById("wnd[1]/tbar[0]/btn[0]").press  
$session.findById("wnd[0]").sendVKey(3)  
$session.findById("wnd[0]").sendVKey(3)  
  
Clippit($dbCount)  
  
; End-----
```

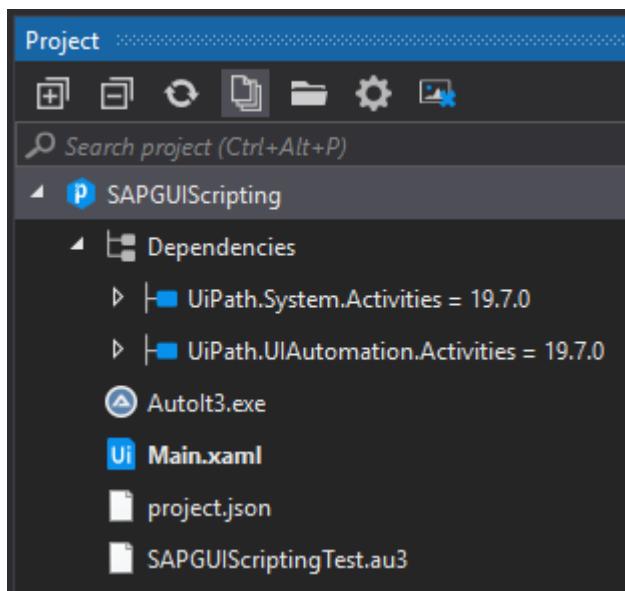

## Variables in UiPath

Name	Variable type	Scope	Default
dbCount	String	Sequence	Enter a VB expression
ConnectionNumber	String	Sequence	Enter a VB expression
SessionNumber	String	Sequence	Enter a VB expression
Create Variable			

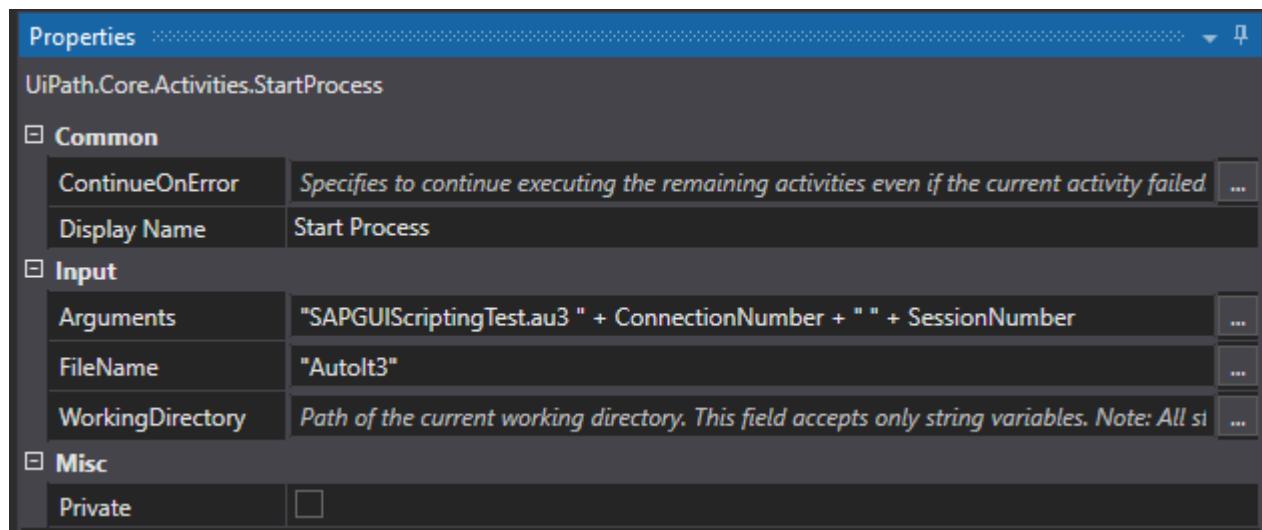

## Sequence in UiPath

**Hint:** Store the AutoIt script file and the AutoIt3.exe into your project folder.

## Properties of Start Process activity

**Hint:** For the Inter Process Communication (IPC) with the AutoIt interpreter the clipboard is using. To synchronize the Start Process activity an Invoke Code activity is used.

### Code for Invoke Code activity

```
' Begin-----  
Dim p() As Process  
  
Do  
    p = System.Diagnostics.Process.GetProcessesByName ("AutoIt3")  
    System.Threading.Thread.Sleep(500)  
Loop Until p.Length = 0  
  
' End-----
```

**Hint:** To get the result from the AutoIt script the content of the clipboard is read.

# RPA - Integration Scenario - UiPath - VBScript

## VBScript

**Hint:** It is no longer recommended to use VBScript. It is a deprecated script language that is no longer being developed. Yes, there are many examples on the Internet that can be used, but basically [PowerShell](#) should be used for every new development.

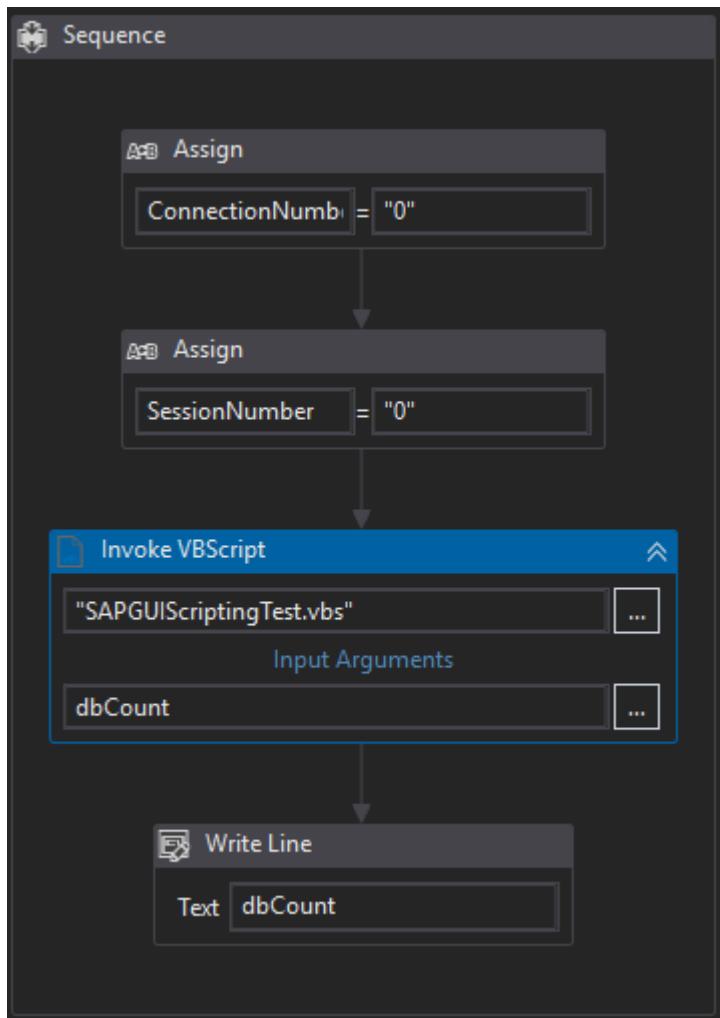

```
' Begin-----  
  
Option Explicit  
  
Dim ConnectionNumber, SessionNumber  
Dim SapGuiAuto, application, connection, session, dbCount  
  
ConnectionNumber = WScript.Arguments.Item(0)  
SessionNumber = WScript.Arguments.Item(1)  
  
If Not IsObject(application) Then  
    Set SapGuiAuto = GetObject("SAPGUI")  
    Set application = SapGuiAuto.GetScriptingEngine  
End If  
  
If Not IsObject(connection) Then  
    Set connection = application.Children(CInt(ConnectionNumber))  
End If  
  
If Not IsObject(session) Then  
    Set session = connection.Children(CInt(SessionNumber))  
End If  
  
session.findById("wnd[0]/tbar[0]/okcd").text = "/nSE16"  
session.findById("wnd[0]").sendVKey 0  
session.findById("wnd[0]/usrctxtDATAFLOW-TABLENAME").text = "TADIR"  
session.findById("wnd[0]/usrctxtDATAFLOW-TABLENAME").caretPosition = 5  
session.findById("wnd[0]").sendVKey 0  
session.findById("wnd[0]").sendVKey 31  
  
dbCount = session.findById("wnd[1]/usr/txtG_DBCOUNT").Text  
  
session.findById("wnd[1]/tbar[0]/btn[0]").press  
session.findById("wnd[0]").sendVKey 3  
session.findById("wnd[0]").sendVKey 3  
  
WScript.Echo CStr(dbCount)  
  
' End-----
```

**Hint:** If you use Option Explicit you must define the arguments of Invoke VBScript activity too.

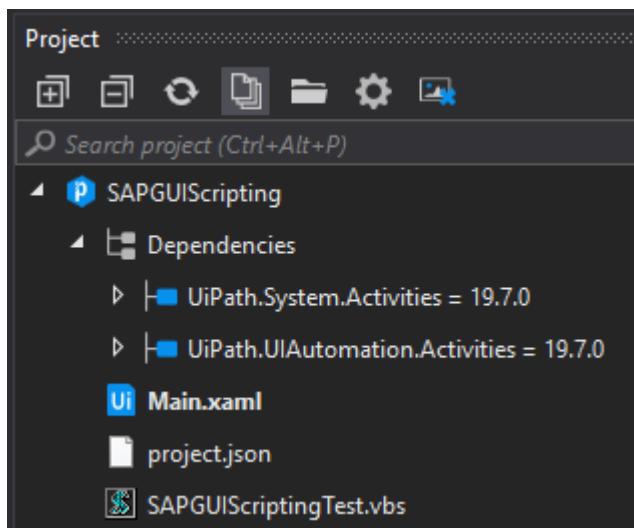

## Variables in UiPath

Name	Variable type	Scope	Default
dbCount	String	Sequence	Enter a VB expression
ConnectionNumber	String	Sequence	Enter a VB expression
SessionNumber	String	Sequence	Enter a VB expression
<i>Create Variable</i>			

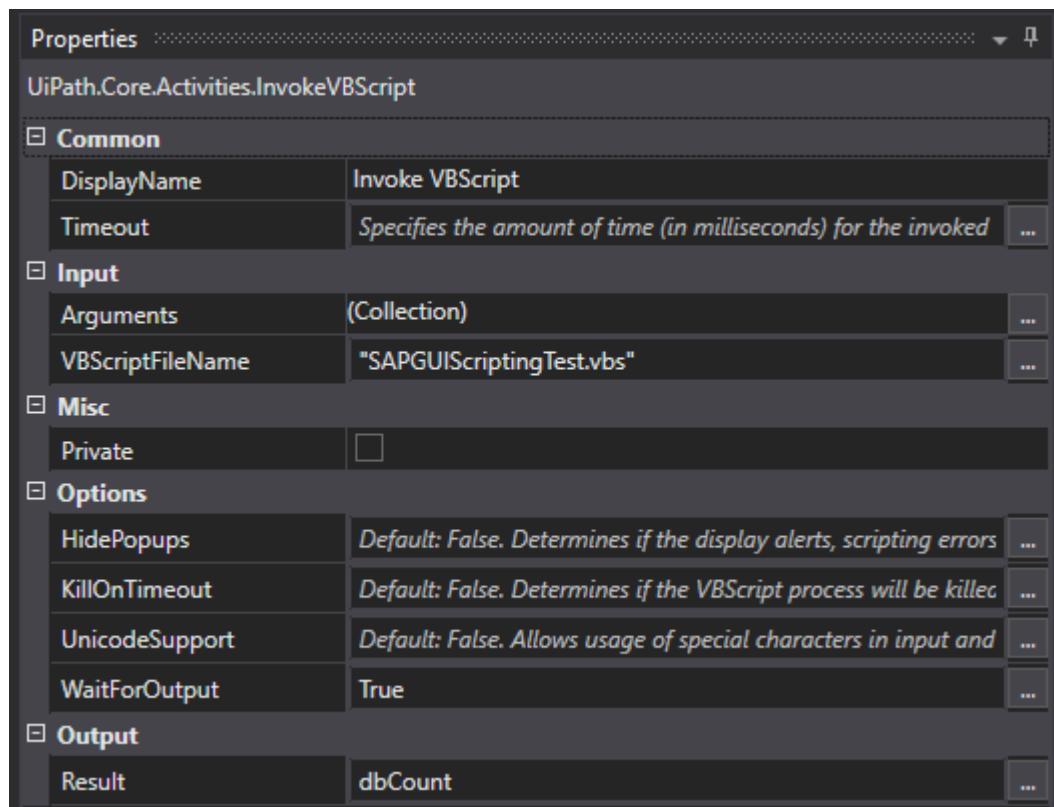

## Sequence in UiPath

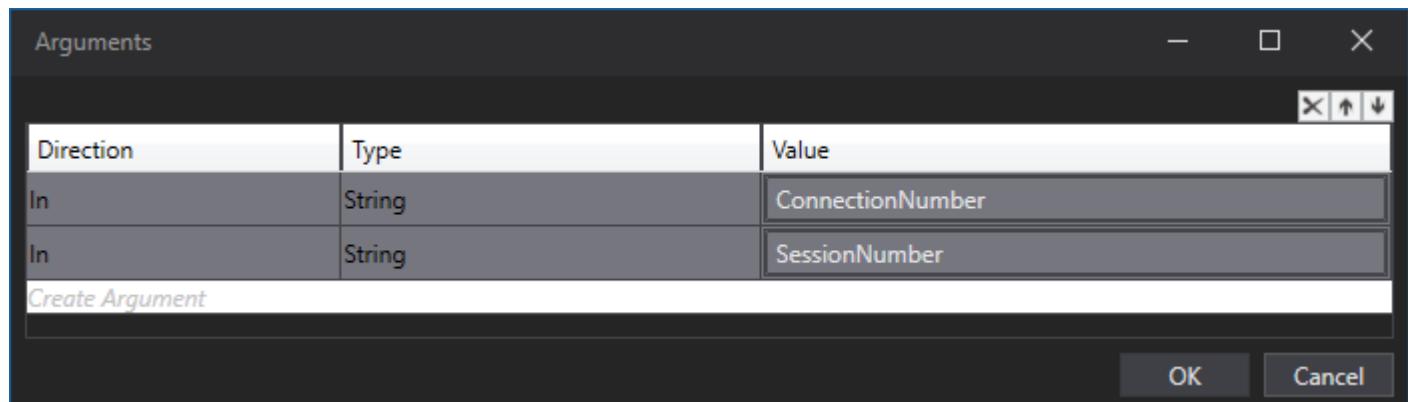

**Hint:** Store the VBScript file into your project folder.

## Properties of Invoke VBScript activity

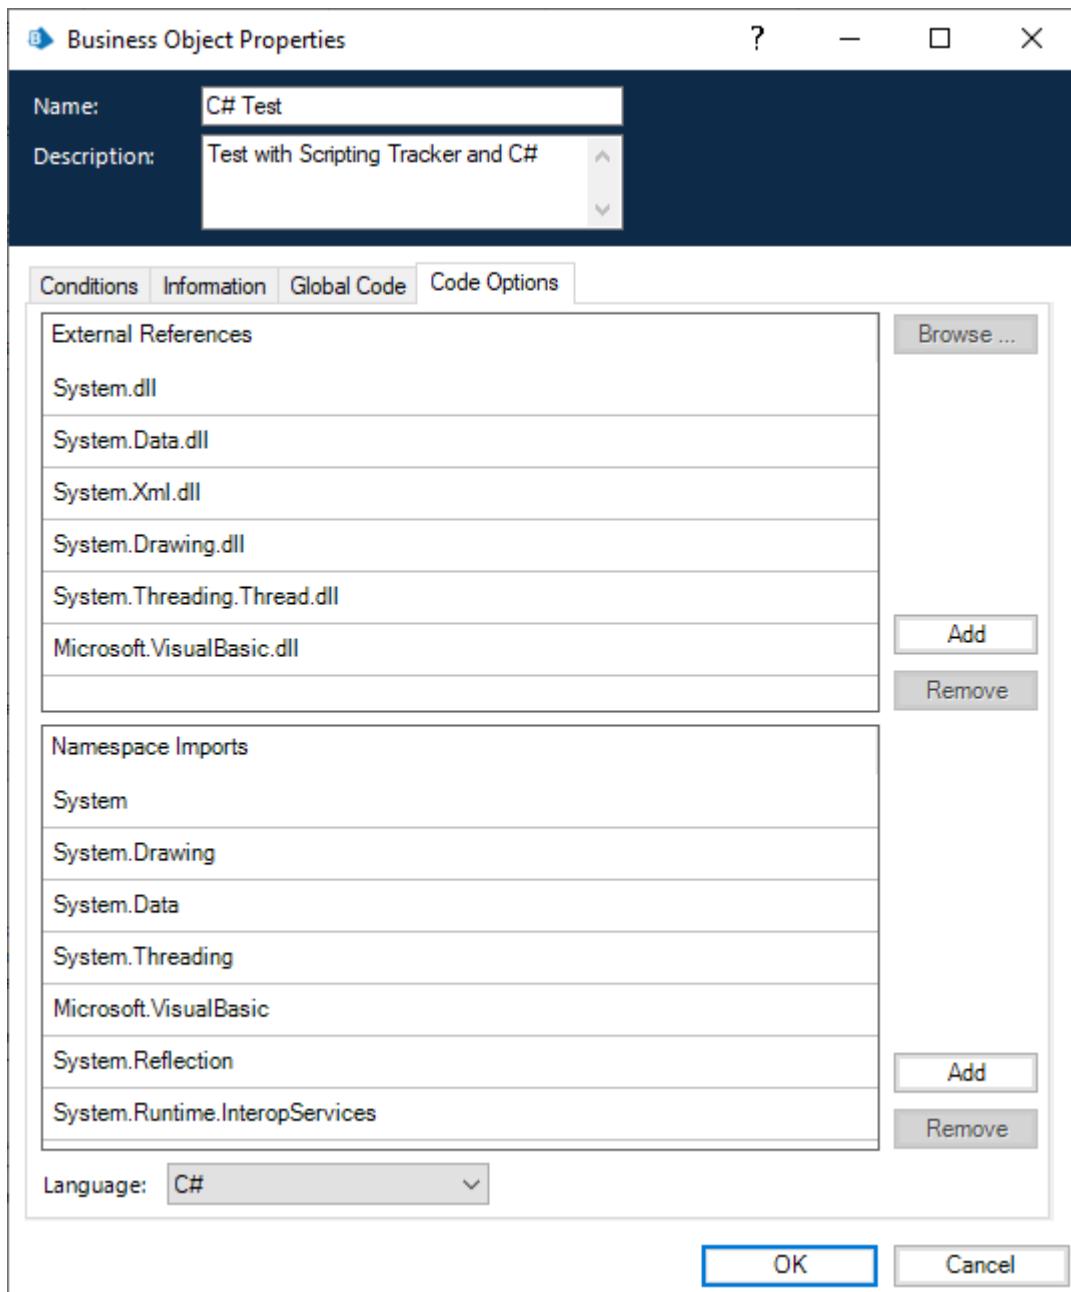

## Arguments of Invoke VBScript activity

## RPA - Integration Scenario - Blue Prism - C#

Before you can use the C# code, which was recorded with Scripting Tracker, you must add an external reference. It is necessary to add the library Microsoft.VisualBasic.dll, because the GetObject method is used. Also the namespaces Microsoft.VisualBasic, System.Reflection and System.Runtime.InteropServices must be imported.

Record your activities with C#, add the code snippet Blue Prism, ...

The screenshot shows the Blue Prism interface. The 'Main' stage is selected in the stage list. Below the stage list, a snippet of C# code is displayed:

```
ion, "findById", new object[1]{ "wnd[0]" } );
```

... move your recorded code to the correct position and copy and paste your C# code from Scripting Tracker to your code stage.

Code Properties

Name: Code1

Description:

Inputs Outputs Code Parameters

```

1 //--Begin--

## RPA - Integration Scenario - Blue Prism - VB.NET

To work with VB.NET is the most comfortable way to execute SAP GUI Scripting with Blue Prism. Record your activities with VB.NET, press the button open source in external editor  and ...

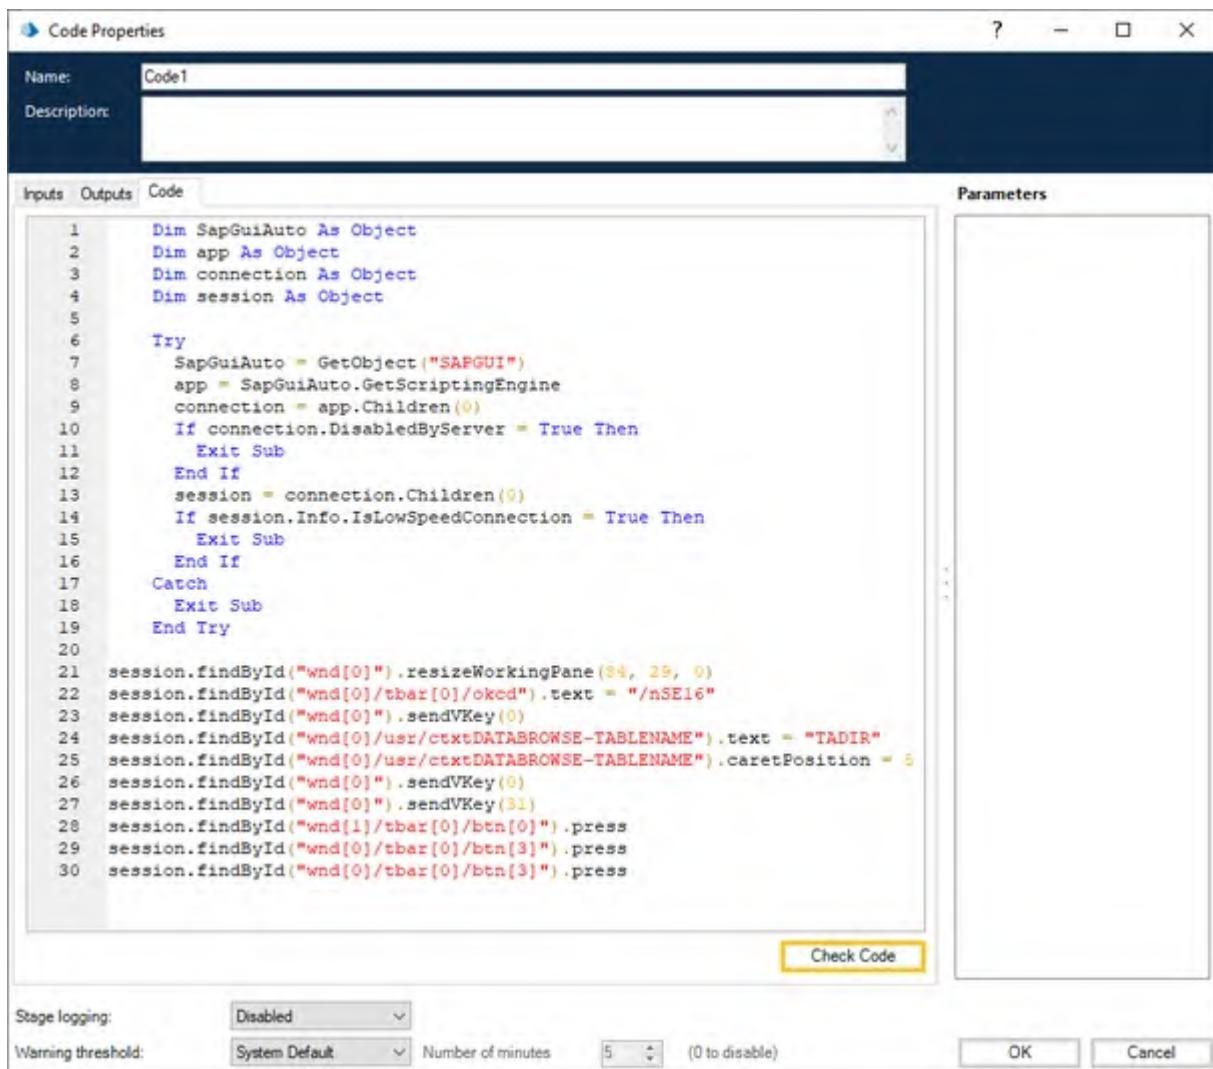

The screenshot shows a Notepad++ window with the file path C:\Dummy\Tracker\Tracker\_EditScript.vb. The code is written in VB.NET and performs the following steps:

```
1  '-Begin-----
2
3  Public Module SAPGUIScripting
4
5    Sub Main()
6      Dim SapGuiAuto As Object
7      Dim app As Object
8      Dim connection As Object
9      Dim session As Object
10
11      Try
12        SapGuiAuto = GetObject("SAPGUI")
13        app = SapGuiAuto.GetScriptingEngine
14        connection = app.Children(0)
15        If connection.DisabledByServer = True Then
16          Exit Sub
17        End If
18        session = connection.Children(0)
19        If session.Info.IsLowSpeedConnection = True Then
20          Exit Sub
21        End If
22      Catch
23        Exit Sub
24      End Try
25
26      session.findById("wnd[0]").resizeWorkingPane(84,-29,-0)
27      session.findById("wnd[0]/tbar[0]/okcd").text = "/nSE16"
28      session.findById("wnd[0]").sendVKey(0)
29      session.findById("wnd[0]/usrctxtDATAFLOW-TABLENAME").text = "TADIR"
30      session.findById("wnd[0]/usrctxtDATAFLOW-TABLENAME").caretPosition = 5
31      session.findById("wnd[0]").sendVKey(0)
32      session.findById("wnd[0]").sendVKey(31)
33      session.findById("wnd[1]/tbar[0]/btn[0]").press
34      session.findById("wnd[0]/tbar[0]/btn[3]").press
35      session.findById("wnd[0]/tbar[0]/btn[3]").press
36
37      End Sub
38
39  End Module
40
41  '-End-----
```

Visual Bar: length : 1.251 lines : 44 Ln:44 Col:1 Sel:0|0 Windows (CR LF) UTF-8-BOM INS

... copy the code sequence between Sub Main() and End Sub into your code stage.

## RPA - Connection and Session Number - UiPath

In the area of SAP GUI for Windows automation plays the identifier (ID) of the UI elements an important role. It looks e.g. like this:

```
/app/con[0]/ses[0]/wnd[0]/usr/cnt1IMAGE_CONTAINER/shellcont/shell
```

The ID starts always with /app, the GuiApplication. Then follows /con[0], which is the connection with its number, the GuiConnection. Then follows /ses[0], which is the session with its number, the GuiSession. You can find [more information here about the SAP GUI Scripting Object Model](#). When you log on to an SAP system, you establish a connection.

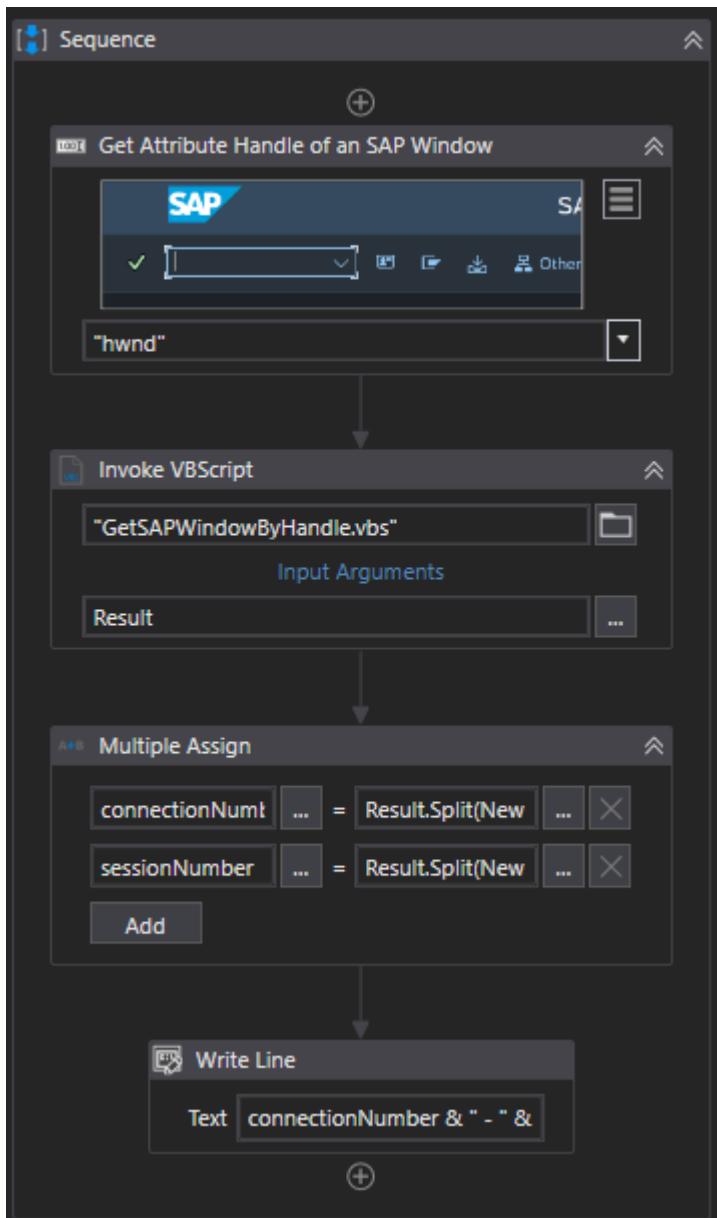

In the context of UiPath are the application, connection and session without significance. UiPath detects the window and an UI element with a selector e.g. like this:

```
<wnd app='saplogon.exe' cls='SAP_FRONTEND_SESSION' title='SAP Easy Access*' />
<sap id='usr/cnt1IMAGE_CONTAINER/shellcont/shell' />
```

As we can see the window is identified with other selectors and below the window the SAP GUI Scripting ID is used, beginning with the user screen /usr.

To get the connection and session number in UiPath it is possible to use the Get Attribute activity with the handle of the window, hwnd. The handle is transferred to a VBScript and the script delivers the session ID, the connection and session number back to the project. But this is not necessary at all. A recorded SAP GUI script can also be inserted in the main routine instead.

With this approach we have the possibility to use existing SAP GUI scripts seamlessly in UiPath. All we have to do is change the recorded connection and session number with variables. The advantages of this approach are, that we can use all the possibilities of the SAP GUI Scripting API and that we can use existing consolidated scripts furthermore. The disadvantage of this approach is, that we pass the control of the automation to another engine, so the complexity increases. It depends on the use case.

```

' Begin-----
' Directives
Option Explicit

' Function FindSAPWindowsByHandle
Function FindSAPWindowByHandle(hSAPWnd)

Dim SapGuiAuto, app, CollCon, oCon, CollSes, oSes, hWnd, i, j

Set SapGuiAuto = GetObject("SAPGUI")
If Not IsObject(SapGuiAuto) Then
    Exit Function
End If

Set app = SapGuiAuto.GetScriptingEngine
If Not IsObject(app) Then
    Exit Function
End If

' Get all connections
Set CollCon = app.Connections()
If Not IsObject(CollCon) Then

```

```

        Exit Function
    End If

    ' Loop over connections
    For i = 0 To CollCon.Count() - 1
        Set oCon = app.Children(CLng(i))
        If Not IsObject(oCon) Then
            Exit Function
        End If

        ' Get all sessions of a connection
        Set CollSes = oCon.Sessions()
        If Not IsObject(CollSes) Then
            Exit Function
        End If

        ' Loop over sessions
        For j = 0 To CollSes.Count() - 1

            Set oSes = oCon.Children(CLng(j))
            If Not IsObject(oSes) Then
                Exit Function
            End If

            If oSes.Busy() = vbFalse Then
                hWnd = oSes.findById("wnd[0]").Handle
                If hSAPWnd = hWnd Then
                    FindSAPWindowByHandle = oSes.ID
                End If
            End If

        Next
    Next

End Function

' Sub Main
Sub Main()

    Dim HandleSAPWindow
    Dim sessionId, connectionNumber, sessionNumber
    Dim pos, Len

    HandleSAPWindow = CLng(WScript.Arguments.Item(0))
    sessionId = CStr(FindSAPWindowByHandle(HandleSAPWindow))

    pos = InStr(sessionId, "con["") + 4
    Len = InStr(pos, sessionId, "]") - pos
    connectionNumber = CLng(Mid(sessionId, pos, Len))

    pos = InStr(sessionId, "ses["") + 4
    Len = InStr(pos, sessionId, "]") - pos
    sessionNumber = CLng(Mid(sessionId, pos, Len))

    WScript.Echo(sessionId & ";" & connectionNumber & ";" & sessionNumber)

End Sub

' Main
Main

' End-----

```

## RPA - Session ID and Session Number - UiPath

Beside the handle of the window, which is described [here, how to handle Connection and Session Number](#), it is also possible to use instead the session ID and session number to identify an SAP session window unique.

The script detects the session via SystemSessionID and SessionNumber. Both information delivers the Get Attribute activity. It loops over all connections and sessions to find the correct one. When it has found the right session it calls the Sub Action. In this sub routine you can use the attributes which are not supported by the Get Attribute activity, in this example VisibleRowCount.

```
' Begin-----
Option Explicit

' Sub Action
Sub Action(session)

    Dim Id, oElement
    Id = "wnd[0]/" + WScript.Arguments.Item(2)
    Set oElement = session.findById(Id)
    WScript.Echo CStr(oElement.VisibleRowCount)

End Sub

' Sub GetSession
Sub GetSession(SessionID, SessionNumber)

    Dim SapAppl, SapGuiAuto, CollCon, i, oCon, CollSes, j, oSes
    Dim oSesInf, SessID, SessNumber

    Set SapGuiAuto = GetObject("SAPGUI")
    If Not IsObject(SapGuiAuto) Then
        WScript.Echo "Error: GetObject"
        Exit Sub
    End If

    Set SapAppl = SapGuiAuto.GetScriptingEngine
    If Not IsObject(SapAppl) Then
        WScript.Echo "Error: GetScriptingEngine"
        Exit Sub
    End If

    Set CollCon = SapAppl.Connections()
    If Not IsObject(CollCon) Then
        WScript.Echo "Error: No Connections"
        Exit Sub
    End If

    ' Loop over connections
    For i = 0 To CollCon.Count() - 1

        Set oCon = SapAppl.Children(CLng(i))
        If Not IsObject(oCon) Then
            WScript.Echo "Error at Connection"
            Exit Sub
        End If

        Set CollSes = oCon.Sessions()
        If Not IsObject(CollSes) Then
            WScript.Echo "Error: No Sessions"
        End If
    Next
End Sub
```

```

    Exit Sub
End If

' Loop over sessions
For j = 0 To CollSes.Count() - 1

    Set oSes = oCon.Children(CLng(j))
    If Not IsObject(oSes) Then
        WScript.Echo "Error at Session"
        Exit Sub
    End If

    If oSes.Busy() = vbFalse Then

        Set oSesInf = oSes.Info()

        If IsObject(oSesInf) Then

            SessID = oSesInf.SystemSessionID()
            SessNumber = CStr(oSesInf.SessionNumber() - 1)

            If SessID = SessionID And SessNumber = SessionNumber Then
                Action oSes
            End If

        End If

    End If

End If

Next

Next

End Sub

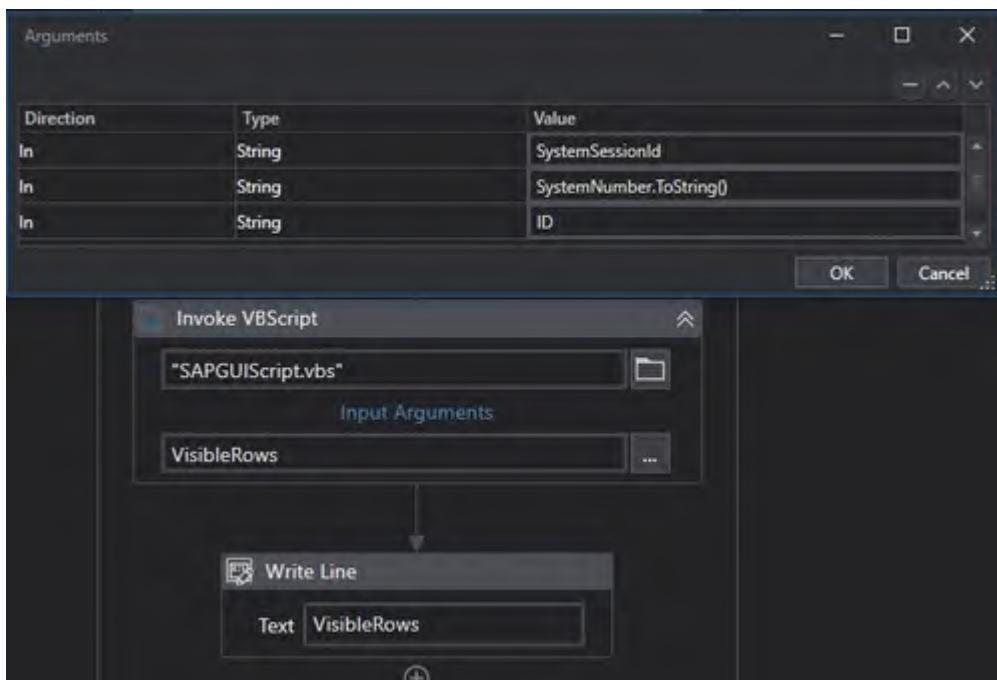

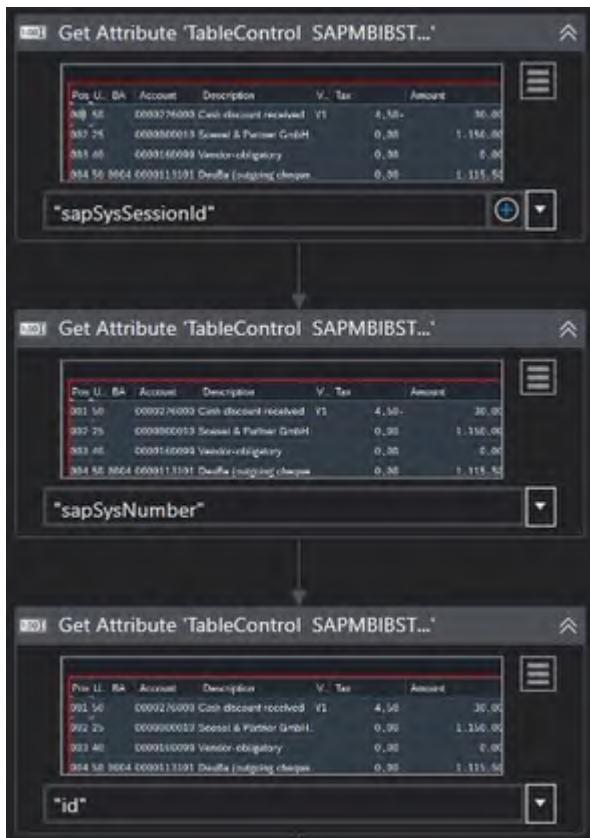

' Sub Main
Sub Main()
    GetSession WScript.Arguments.Item(0), WScript.Arguments.Item(1)
End Sub

' Main
Main

' End-----

```

In the UiPath workflow I detect at first the attributes SystemSessionId, SessionNumber and the ID of the UI element, in this example a table control.

## Restrictions

- See also OSS note 587202 - Restrictions when using SAP GUI Scripting.
- Changes in long texts with the full screen editor are not recorded, because no change event is fired from SAP GUI for Windows.  
To check this call TAC SO10, choose menu item Settings > SAPscript > PC Editor and enable the checkbox Graphical PC Editor. Choose a standard text and press display.
- In ALV-Grid the first position of the context menu is not recorded, because no change event is fired from SAP GUI for Windows.
- The text of a TextEdit control is not read because text lengths over 16702 characters cause a crash.
- Scripting Trackers recorder use the change event from SAP GUI Scripting. If no event is fired from SAP GUI for Windows, Scripting Tracker can't record the activities, equally the SAP standard.
- Scripting Tracker is an UTF8 version, it supports ANSI only with VBS files.
- Differences between SAP GUI for Windows and NetWeaver Business Client (NWBC)
  - The correct entry in the running object table (ROT) for the SAP GUI Scripting inside NWBC is SAPGUISERVER.
  - In the NWBC is no Toolbar[1] visible and not useable. Older SAP GUI Scripts will not work and there is no equivalent.
  - If a second NWBC window is open and the method Connections from the Application object with the property Count is used, it is not possible to detect more than one connection. SAP GUI Scripting uses only the first NWBC client window, because NWBC creates multiple instances of SAPGUISERVER in the running object table (ROT) and GetObject gets the first entry.
  - If a SAP® GUI Script is running in an NWBC window and the script is calling the method GetScriptingEngine a SAPGUI entry is registering in the ROT.

Momentary conclusion: SAP GUI Scripting in the context of NWBC offers not the same possibilities as in SAP GUI for Windows context now.

- Differences between SAP GUI for Windows and SAP GUI window in ABAP in Eclipse
  - The correct entry in the running object table (ROT) for the SAP GUI Scripting inside ABAP in Eclipse is SAPGUISERVER.
- Using SAP GUI for Windows, NWBC and ABAP in Eclipse with SAP GUI Scripting parallel at the same time

Momentary recommendation: Don't use SAP GUI for Windows, NWBC and/or ABAP in Eclipse with Scripting Tracker parallel and use only one instance of NWBC or ABAP in Eclipse at the same time with Scripting Tracker.

## Preparation for VBA

To use SAP GUI Scripting inside VBA you can reference to the ActiveX library. In this case the VBA-IDE supports you with code completion, of the methods and attributes, and with the Object browser (F2).

Here the [description for referencing the object library](#).

## Frames - WSH - VBScript

The Windows Script Host (WSH) is an automation technology from Microsoft and it is independent from the scripting language. Visual Basic Scripting, also known as VBScript, is an Active Scripting language which bases on the WSH. The language of VBScript is modeled on Visual Basic. VBScript is widely used and the SAP GUI Scripting Recorder, of the SAP GUI for Windows, uses VBScript as its standard language.

**Hint:** It is no longer recommended to use VBScript. It is a deprecated script language that is no longer being developed. Yes, there are many examples on the Internet that can be used, but basically [PowerShell](#) should be used for every new development.

SAP has described the effects in Note 3484031 - Upcoming deprecation of VBScript by Microsoft - impact on SAP GUI Scripting.

More information are available at [https://learn.microsoft.com/en-us/previous-versions/t0aew7h6\(v=vs.85\)](https://learn.microsoft.com/en-us/previous-versions/t0aew7h6(v=vs.85)) [2024/08/14]

```
' Begin-----
Option Explicit

Sub Main()

    Dim SapGuiAuto, app, connection, session

    Set SapGuiAuto = GetObject("SAPGUI")
    If Not IsObject(SapGuiAuto) Then
        Exit Sub
    End If

    Set app = SapGuiAuto.GetScriptingEngine
    If Not IsObject(app) Then
        Exit Sub
    End If

    app.HistoryEnabled = False

    Set connection = app.Children(0)
    If Not IsObject(connection) Then
        Exit Sub
    End If

    If connection.DisabledByServer = True Then
        Exit Sub
    End If

    Set session = connection.Children(0)
    If Not IsObject(session) Then
        Exit Sub
    End If

    If session.Busy = True Then
        Exit Sub
    End If

    If session.Info.IsLowSpeedConnection = True Then
        Exit Sub
    End If
```

```
app.HistoryEnabled = True  
End Sub  
  
' Main  
Main  
  
' End-----
```

## Frames - WSH - JScript

The Windows Script Host (WSH) is an automation technology from Microsoft and it is independent from the scripting language. JScript, Microsoft's implementation of the ECMA 262 language specification (JavaScript, ECMAScript Edition 3), is an Active Scripting language which bases on the WSH. SAP has described in Note 3484031 - Upcoming deprecation of VBScript by Microsoft - impact on SAP GUI Scripting - that is planned to use JScript as an alternative script recording feature in SAP GUI for Windows 8.10.

More information are available at [https://learn.microsoft.com/en-us/previous-versions/hbxc2t98\(v=vs.85\)](https://learn.microsoft.com/en-us/previous-versions/hbxc2t98(v=vs.85)) [2024/08/14]

    Return
EndIf

;>Insert your SAP GUI Scripting code here<

$application.HistoryEnabled = True

EndFunc

; Main
```

```
Main()
```

```
; End -----
```

To start SAP Logon it is also possible to use SAP shortcut.

```
sapshcut.exe -system=ABC -client=001 -user=USER -pw=secret -language=EN
```

But there seem to be problems with the SAPGUI entry in the Running Object Table (ROT) when used alternately with saplogon.exe.

## **Examples - VBA (Visual Basic for Applications)**

You can find information to prepare VBA [here](#).

[ClearAllChangeable Fields](#)

[Native Window Dialogs](#)

[Session](#)

## Examples - VBA - ClearAllChangeableFields

In some cases users have defined specific default values. In the case of automation, this can lead to processing errors. To exclude this, all contents of fields of a screen can be deleted with this approach.

```
' Begin -----
Option Explicit

' ClearAllChangeableFields -----
'

' Clear all changeable fields of an SAP GUI session
'

' -----
Sub ClearAllChangeableFields(obj As Object)

    Dim cntSess As Integer
    Dim i As Integer
    Dim Child As Object

    On Error Resume Next

    cntSess = obj.Children.Count()
    If cntSess = 0 Then
        On Error GoTo 0
        Exit Sub
    End If

    For i = 0 To cntSess - 1
        Set Child = obj.Children.Item(CLng(i))
        ClearAllChangeableFields Child
        If Child.Changeable = vbTrue And Child.ContainerType = vbFalse Then
            Select Case Child.Type()
                Case "GuiCheckBox"
                    Child.Selected = 0
                Case "GuiCTextField", "GuiTextField"
                    Child.Text = ""
                Case "GuiComboBox"
                    Child.Key = " "
            End Select
        End If
    Next

    On Error GoTo 0

End Sub

Sub Main()

    Dim SapGuiAuto As Object
    Dim app As SAPFEWSELib.GuiApplication
    Dim connection As SAPFEWSELib.GuiConnection
    Dim session As SAPFEWSELib.GuiSession

    Set SapGuiAuto = GetObject("SAPGUI")
    Set app = SapGuiAuto.GetScriptingEngine
    Set connection = app.Children(1)
    Set session = connection.Children(0)

    ClearAllChangeableFields session

```

```
End Sub
```

```
' End -----
```

## Examples - VBA - Native Window Dialogs

```
" Begin -----  
  
REPORT Z_DIALOG.  
  
DATA:  
  LV_FILENAME TYPE STRING VALUE '',  
  LV_PATH TYPE STRING VALUE '',  
  LV_RESULT TYPE I.  
  
CALL METHOD CL_GUI_FRONTEND_SERVICES=>FILE_SAVE_DIALOG  
EXPORTING  
  WINDOW_TITLE = 'Descarga de archivos'  
  DEFAULT_EXTENSION = 'pdf'  
CHANGING  
  FILENAME = LV_FILENAME  
  PATH = LV_PATH  
  FULLPATH = LV_PATH  
  USER_ACTION = LV_RESULT.  
  
WRITE: / LV_FILENAME, / LV_PATH, / LV_RESULT.  
" End -----
```

```
' Begin -----  
  
' PtrSafe keyword is necessary to work correctly on  
' 32-bit and 64-bit platforms.  
  
Private Declare PtrSafe Function FindWindow Lib "user32.dll" Alias  
"FindWindowA" ( _  
  ByVal lpClassName As String, ByVal lpWindowName As String) As Long  
  
Private Declare PtrSafe Function SetForegroundWindow Lib "user32" ( _  
  ByVal hwnd As Long) As Long

  Dim hwnd As Long  
  
  hwnd = FindWindow(vbNullString, "Descarga de archivos")  
  
  If hwnd > 0 Then  
  
    SetForegroundWindow hwnd  
  
    Sleep 1000  
  
    SendKeys "Test.txt", True  
    SendKeys "{TAB}{TAB}{TAB}", True  
    SendKeys "{ENTER}", True  
  
  End If  
  
End Sub
```

' End -----

## Examples - VBA - Session

```
' Begin-----
'
' Attempt to determine all sessions, even if they are blocked with a
' debugger.
'
' Hint: This approach doesn't work, because as soon as the session is
' handled in the For Each loop, the program blocks until the session is
' no longer blocked by the debugger.
'
' To reproduce this, simply call the debugger in a session with /h in
' the Ok field and start any transaction.
'
' The same approach works with PowerShell.
'

Option Explicit

```

```
    Exit Sub
```

```
errorHandler:
```

```
    Debug.Print Err.Description
```

```
End Sub
```

```
' End-----
```

## Examples - WSH (Windows Script Host)

**Hint:** It is no longer recommended to use VBScript. It is a deprecated script language that is no longer being developed. Yes, there are many examples on the Internet that can be used, but basically [PowerShell](#) should be used for every new development.

SAP has described the effects in Note 3484031 - Upcoming deprecation of VBScript by Microsoft - impact on SAP GUI Scripting.

End If

MsgBox session.Info.Transaction()

' End -----
```

## Examples - WSH - Start Multiple TACs (2)

To be able to process a higher amount of data in the same time, parallelization is a valid approach. The SAP GUI scripting, as an automation interface to the SAP GUI for Windows, is a basis for many RPA platforms. In this context it is worth taking a look at the parallelization capabilities of the SAP GUI Scripting.

The following example code has three routines:

### 1. Main

Connects the open session, just like the standard does. Then two additional sessions are opened with different transaction codes, in our example the SE16 and SE37. After that the session object via GetSession is detected, based on the transaction code, and an external script is started via Action.

### 2. GetSession

Loops over all the sessions of the connection to detect the session with the transaction code and delivers the session object.

### 3. Action

Starts an external script with the connection and session number as parameters.

```
' Begin -----
Option Explicit

' Sub Action -----
'

' Starts external script with the connection number, session number
' and transaction code as parameters
'

' -----
Sub Action(con, ses, TAC)

    Dim objShell, RegEx, Matches, con_no, ses_no

    ' Extracts connection and session number
    Set RegEx = New RegExp
    RegEx.Pattern = "[\d]+"
    Set Matches = RegEx.Execute(con)
    con_no = Matches(0).Value
    Set Matches = RegEx.Execute(ses)
    ses_no = Matches(0).Value

    ' Executes the external script
    Set objShell = WScript.CreateObject("WScript.Shell")
    objShell.Run "YourScript." + TAC + ".vbs " + con_no + " " + ses_no

End Sub

' Function GetSession -----
'

' Detects a session by transaction code (TAC)
'

' -----
Function GetSession(connection, TAC)

    Dim sessions, session, sessionInfo, j, i

    Set sessions = connection.Sessions()
```

```

' Loop over sessions
For Each session In sessions
    If session.Busy() = vbFalse Then
        Set sessionInfo = session.Info()
        If sessionInfo.Transaction() = TAC Then
            Set GetSession = session
        End If
    End If
Next

End Function

Sub Main()

    Dim SapGuiAuto, app, connection, session
    Dim session_SE16, session_SE37
    Dim arr

    Set SapGuiAuto = GetObject("SAPGUI")
    If Not IsObject(SapGuiAuto) Then
        Exit Sub
    End If

    Set app = SapGuiAuto.GetScriptingEngine
    If Not IsObject(app) Then
        Exit Sub
    End If

    Set connection = app.Children(0)
    If Not IsObject(connection) Then
        Exit Sub
    End If

    If connection.DisabledByServer = True Then
        Exit Sub
    End If

    Set session = connection.Children(0)
    If Not IsObject(session) Then
        Exit Sub
    End If

    If session.Info.IsLowSpeedConnection = True Then
        Exit Sub
    End If

    ' Open different sessions with different TACs
    session.findById("wnd[0]/tbar[0]/okcd").text = "/oSE16"
    session.findById("wnd[0]").sendVKey 0
    session.findById("wnd[0]/tbar[0]/okcd").text = "/oSE37"
    session.findById("wnd[0]").sendVKey 0
    WScript.Sleep 500

    ' Detects the session with TAC SE16 and calls an external script
    Set session_SE16 = GetSession(connection, "SE16")
    arr = Split(session_SE16.ID, "/")
    Action arr(2), arr(3), "SE16"

    ' Detects the session with TAC SE37 and calls an external script
    Set session_SE37 = GetSession(connection, "SE37")
    arr = Split(session_SE37.ID, "/")
    Action arr(2), arr(3), "SE37"

End Sub

```

```
' Main -----
Main()

' End -----
```

## YourScript.SE16.vbs

Here the script which automates the TAC SE16. First the connection and session number of the arguments are read. Then we have the standard sequence for establishing the connection to the session, with use of the passed arguments. Last but not least a for loop that does the same thing over and over again.

```
' Begin -----

Set Args = WScript.Arguments
con = Args(0)
ses = Args(1)

Set SapGuiAuto = GetObject("SAPGUI")
If Not IsObject(SapGuiAuto) Then
    WScript.Quit
End If

Set app = SapGuiAuto.GetScriptingEngine
If Not IsObject(app) Then
    WScript.Quit
End If

Set connection = app.Children(CLng(con))
If Not IsObject(connection) Then
    WScript.Quit
End If

If connection.DisabledByServer = True Then
    WScript.Quit
End If

Set session = connection.Children(CLng(ses))
If Not IsObject(session) Then
    WScript.Quit
End If

If session.Info.IsLowSpeedConnection = True Then
    WScript.Quit
End If

For i = 1 To 50
    session.findById("wnd[0]/usr/ctxtDATAFLOW-TABLENAME").text = "TADIR"
    session.findById("wnd[0]/usr/ctxtDATAFLOW-TABLENAME").caretPosition = 5
    session.findById("wnd[0]").sendVKey 0
    session.findById("wnd[0]").sendVKey 31
    session.findById("wnd[1]/tbar[0]/btn[0]").press
    session.findById("wnd[0]/tbar[0]/btn[3]").press
Next

' End -----
```

## YourScript.SE37.vbs

Here the script which automates the TAC SE37. It does exactly the same as above.

```
' Begin -----  
  
Set Args = WScript.Arguments  
con = Args(0)  
ses = Args(1)  
  
Set SapGuiAuto = GetObject("SAPGUI")  
If Not IsObject(SapGuiAuto) Then  
    WScript.Quit  
End If  
  
Set app = SapGuiAuto.GetScriptingEngine  
If Not IsObject(app) Then  
    WScript.Quit  
End If  
  
Set connection = app.Children(CLng(con))  
If Not IsObject(connection) Then  
    WScript.Quit  
End If  
  
If connection.DisabledByServer = True Then  
    WScript.Quit  
End If  
  
Set session = connection.Children(CLng(ses))  
If Not IsObject(session) Then  
    WScript.Quit  
End If  
  
If session.Info.IsLowSpeedConnection = True Then  
    WScript.Quit  
End If  
  
For i = 1 To 25  
    session.findById("wnd[0]/usr/ctxtRS38L-NAME").text = "RFC_READ_TABLE"  
    session.findById("wnd[0]/usr/ctxtRS38L-NAME").caretPosition = 14  
    session.findById("wnd[0]/usr/btnBUT3").press  
    session.findById("wnd[0]/usr/tabsFUNC_TAB_STRIP/tabpHEADER").select  
    session.findById("wnd[0]/usr/tabsFUNC_TAB_STRIP/tabpIMPORT").select  
    session.findById("wnd[0]/usr/tabsFUNC_TAB_STRIP/tabpEXPORT").select  
    session.findById("wnd[0]/usr/tabsFUNC_TAB_STRIP/tabpCHANGE").select  
    session.findById("wnd[0]/usr/tabsFUNC_TAB_STRIP/tabpTABLES").select  
    session.findById("wnd[0]/usr/tabsFUNC_TAB_STRIP/tabpEXCEPT").select  
    session.findById("wnd[0]/tbar[0]/btn[3]").press  
Next  
  
' End -----
```

Now when the script is started, the sessions are opened with the transaction codes. Then other Windows Script Hosts are opened parallel and the scripts for SE16 and SE37 are executed parallel.

## Examples - WSH - HTMLViewer

```
' Begin -----
'
' Get and set the body text of an HTML control on a screen
'
' -----
Sub Main()

    Dim SapGuiAuto, app, connection, session

## Examples - WSH - Copy Table Data to Clipboard with AutoItX

**Hint:** In this example AutoItX is used, because WSH does not offer any functions to use the clipboard.

```
' Open SE16 with table TADIR
session.findById("wnd[0]/tbar[0]/okcd").text = "/nse16"
session.findById("wnd[0]").sendVKey 0
session.findById("wnd[0]/usr/ctxtDATAFLOW-TABLENAME").text = "TADIR"
session.findById("wnd[0]/tbar[1]/btn[7]").press
session.findById("wnd[0]").sendVKey 8

' Select two columnes
session.findById("wnd[0]/usr/cntlGRID1/shellcont/shell").selectColumn("OBJ_NAME")
session.findById("wnd[0]/usr/cntlGRID1/shellcont/shell").selectColumn("SRCSYSTEM")

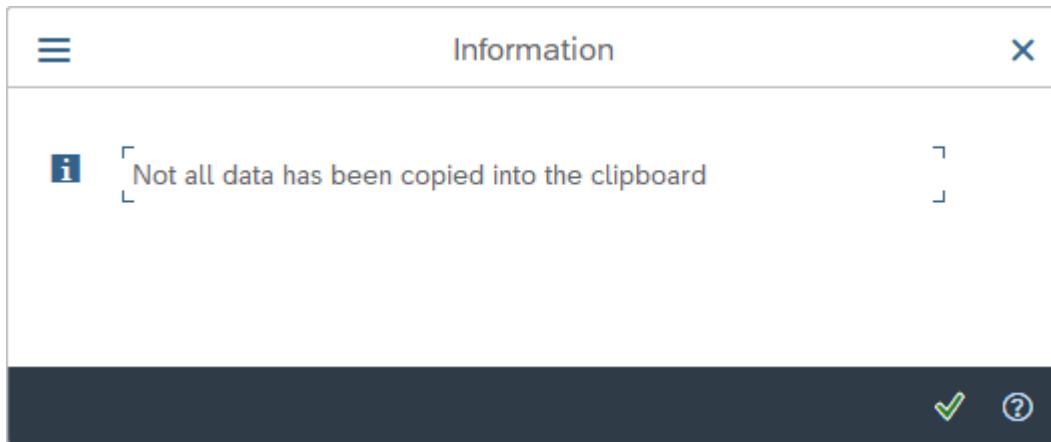

' Bring SAP window to front
Set oAutoIt = WScript.CreateObject("AutoItX3.Control")
oAutoIt.WinActivate session.findById("wnd[0]").Text

' Set the focus to the table
session.findById("wnd[0]/usr/cntlGRID1/shellcont/shell").setFocus

oAutoIt.Sleep 250

' Send keys Ctrl + C to copy the content to the clipboard
oAutoIt.Send "{CTRLDOWN}c{CTRLUP}"
```

If too much data is to be copied, a message is displayed.

**Hint:** With VBScript SendKeys command is it not possible to send the keystrokes Ctrl + C to the SAP control.

## Tracker.ini

Programming Language	Architecture	Section	Keyword	Comment
PowerShell Windows	x64	ProgramConfiguration	EditorExternalIPS1	%WINDIR%\System32\WindowsPowerShell\v1.0\powershell_ise.exe
		ScriptingEngines	PowerShell	%WINDIR%\System32\WindowsPowerShell\v1.0\powershell.exe
	x86	ProgramConfiguration	EditorExternalIPS1	%WINDIR%\SysWOW64\WindowsPowerShell\v1.0\powershell_ise.exe
		ScriptingEngines	PowerShell	%WINDIR%\SysWOW64\WindowsPowerShell\v1.0\powershell.exe
PowerShell Core	x64	ScriptingEngines	PowerShellCore	Set path to pwsh.exe
Autolt	x64	ScriptingEngines	Autolt	Set path to AutoIt3_x64.exe
	x86	ScriptingEngines	Autolt	Set path to AutoIt3.exe
Python		ScriptingEngines	Python	Set path to python.exe
Java Shell	x64	ScriptingEngines	JShell	Set path to JShell.exe and add path to JaCoB-*-x64.dll to PATH environment variable.

**Hint:** Python needs the Win32COM client, from Python for Win32 (pywin32) extensions, to use SAP GUI Scripting. A stability of this integration could not be achieved. For this reason the playback tests were discontinued. Only the recording continues to be checked.

## Tracker.\*2exe.cmd (dotNET)

C# dotNET Framework	x64	%WINDIR%\Microsoft.NET\Framework64\v4.0.30319\csc.exe /target:winexe /platform:x64 /out:Tracker_RunScript.cs.exe /reference:"C:\Windows\Microsoft.NET\Framework64\v4.0.30319\Microsoft.VisualBasic.dll" Tracker_RunScript.cs
	x86	%WINDIR%\Microsoft.NET\Framework\v4.0.30319\csc.exe /target:winexe /platform:x86 /out:Tracker_RunScript.cs.exe /reference:"C:\Windows\Microsoft.NET\Framework\v4.0.30319\Microsoft.VisualBasic.dll" Tracker_RunScript.cs
C# dotNET	x64	Add DOTNET_ROOT environment variable with the path to the dotNET Core SDK and add %DOTNET_ROOT% to the PATH environment variable.
Visual Basic dotNET Framework	x64	%WINDIR%\Microsoft.NET\Framework64\v4.0.30319\vbcs.exe /target:winexe /platform:x64 /out:Tracker_RunScript.vb.exe Tracker_RunScript.vb
	x86	%WINDIR%\Microsoft.NET\Framework\v4.0.30319\vbcs.exe /target:winexe /platform:x86 /out:Tracker_RunScript.vb.exe Tracker_RunScript.vb

## Windows Script Host (VBScript)

**Hint:** It is no longer recommended to use VBScript. It is a deprecated script language that is no longer being developed. For this reason the playback tests were discontinued. Only the recording continues to be checked.

Windows Script Host	x64	Start console with %WINDIR%\System32\cmd.exe
		Command echo %PROCESSOR_ARCHITECTURE% delivers AMD64
		%WINDIR%\System32\wscript.exe [Path\]Tracker_RunScript.vbs
	x86	Start console with %WINDIR%\SysWOW64\cmd.exe
		Command echo %PROCESSOR_ARCHITECTURE% delivers x86
		%WINDIR%\SysWOW64\wscript.exe [Path\]Tracker_RunScript.vbs

## Testing - Transaction Codes

To test different UI elements use transaction code

- *GUIBIBS*, which starts the program SAPMBIBS, or
- *BIBS*, which starts the program SAPLEXAMPLE\_ENTRY\_SCREEN, or
- *GUIT*, which starts the program SAPM\_GUITEST\_PORTABLE, or
- *DWDM*, to open the Demo Center, or
- SE38 with a selection of programs DEMO\_DYNPRO\* or
- *ABAPDOCU*, to open ABAP examples, or
- SE80 with the package SABAPDEMOS or
- *BRFACS02*, e.g. SAPLBRF\_MAINTENANCE:3006, to experiment with program name and screen number (works in S/4HANA with restrictions), or
- 
- SE38 with the report name /SAPDMC/SAPMLSMW, to experiment with program name and screen number, or
- *SAPTEXTEDIT\_TEST\_2* to test TextEdit Control.

## Web Dynpro for ABAP

To test integration scenarios with Web Dynpro for ABAP you can use the Web Dynpro Applications from the following development packages:

- SWDP\_DEMO
- SWDP\_DEMO\_TUTORIALS

## **Requirements**

- Operating system Windows 11 or higher.  
Scripting Tracker should run with Windows 7 or higher, but that was no longer tested.
- Full standard installation of SAP GUI for Windows 8.00 or higher.  
Scripting Tracker should run with full standard installation of SAP GUI for Windows 7.40 or higher, but that was no longer tested .
- Activated SAP GUI Scripting on the presentation and application server.
- Microsoft dotNET Framework 4.8 or higher.  
Scripting Tracker should run with Microsoft dotNET Framework 4.6.2 or higher, but that was no longer tested.

## **Trademarks**

- SAP, NetWeaver, NetWeaver Business Client (NWBC), ABAP and SAP GUI Scripting are registered trademarks of SAP AG
- Windows, Visual Basic for Application (VBA), VBScript, Script Host, PowerShell and Edge are registered trademarks of Microsoft, C# and VB.NET are product names from Microsoft
- Autolt and AutoltX is property of Jonathan Bennet and the Autolt team
- Java and JShell are registered trademarks of Oracle
- Jacob is property of Joe Freeman
- Google, Chrome and Android are registered trademarks of Google
- Python is a registered trademark of Python Software Foundation
- UiPath is a registered trademark of UiPath SRL
- Blue Prism is a registered trademark of Blue Prism Ltd.

## **Scintilla**
